| 1. Battalion.....                         | 8  |
| 2. Regiment .....                         | 8  |
| 3. Brigade .....                          | 8  |
| 4. Division .....                         | 8  |
| 5. Corps .....                            | 8  |
| III. Infantry.....                        | 10 |
| A. Formations.....                        | 10 |
| 1. Line .....                             | 10 |
| 2. Column .....                           | 11 |
| 3. Square .....                           | 13 |
| 4. Skirmish .....                         | 15 |

|                                             |    |
|---------------------------------------------|----|
| 5. Changing Formation .....                 | 16 |
| B. Actions.....                             | 16 |
| 1. Small arms.....                          | 16 |
| 2. Movement .....                           | 17 |
| 3. The charge.....                          | 18 |
| IV. Cavalry .....                           | 20 |
| A. Formations.....                          | 20 |
| 1. Close order/Line .....                   | 20 |
| 2. Open order/Line or Column .....          | 20 |
| 3. Skirmish .....                           | 20 |
| 4. Column .....                             | 20 |
| B. Actions.....                             | 21 |
| 1. Movement .....                           | 21 |
| 2. Charge .....                             | 21 |
| 3. Melee .....                              | 22 |
| 4. Pursuit.....                             | 23 |
| 5. Recall.....                              | 23 |
| 6. Firing from the saddle .....             | 23 |
| 7. Dismounting.....                         | 23 |
| 8. Spiking artillery pieces .....           | 24 |
| V. Artillery .....                          | 25 |
| A. Types.....                               | 25 |
| 1. Cannon .....                             | 25 |
| 2. Howitzers .....                          | 25 |
| 3. Siege cannon.....                        | 26 |
| 4. Mortars.....                             | 26 |
| 5. Garrison and Ship's cannon.....          | 26 |
| 6. Rockets.....                             | 26 |
| 7. Foot Artillery and Horse Artillery ..... | 26 |
| B. The Crew .....                           | 27 |
| 1. Mounting .....                           | 27 |
| 2. Crew points required to fire.....        | 27 |
| 3. Small arms.....                          | 27 |

| 5. Melee .....                              | 27 |
| 6. Screening.....                           | 28 |
| 7. Abandoning the gun.....                  | 28 |
| 8. Limbering/unlimbering.....               | 28 |
| 9. Reloading.....                           | 28 |
| 10. Distracting the crew .....              | 28 |
| 11. Infantry or cavalry supports.....       | 28 |
| 12. Infantry used as crewmen.....           | 28 |
| C. Firing Procedure.....                    | 28 |
| 1. General.....                             | 28 |
| 2. Improving accuracy and range.....        | 29 |
| 3. Anti-personnel.....                      | 29 |

|                                                              |    |
|--------------------------------------------------------------|----|
| 4. Counter battery .....                                     | 29 |
| 5. Structures .....                                          | 30 |
| D. Morale Effect .....                                       | 30 |
| 1. Grand Battery .....                                       | 30 |
| 2. Rockets.....                                              | 30 |
| E. Incendiary Rules.....                                     | 30 |
| 1. General.....                                              | 30 |
| 2. Procedure .....                                           | 30 |
| 3. Fires.....                                                | 30 |
| VI. Morale .....                                             | 31 |
| A. Importance.....                                           | 31 |
| B. Panic level .....                                         | 31 |
| C. Procedure.....                                            | 32 |
| 1. When to shake for morale (see also <b>Chart #2</b> )..... | 32 |
| 2. How to test Morale (see also <b>Chart #2</b> ).....       | 33 |
| 3. Results.....                                              | 35 |
| 4. Rallying (clearing up bad morale) .....                   | 36 |
| D. Pre-Melee Morale.....                                     | 36 |
| 1. Introduction .....                                        | 36 |
| 2. Procedure .....                                           | 36 |
| VII. Melee .....                                             | 40 |
| A. Introduction.....                                         | 40 |
| B. Procedure .....                                           | 40 |
| 1. Number of points involved .....                           | 40 |
| 2. Adjustments .....                                         | 40 |
| 3. Determining results.....                                  | 41 |
| 4. Results.....                                              | 41 |
| 5. Miscellanea.....                                          | 42 |
| C. Bonus Move .....                                          | 42 |
| VIII. Terrain.....                                           | 44 |
| A. Introduction.....                                         | 44 |
| B. Superior Positions .....                                  | 44 |
| 1. Overview.....                                             | 44 |
| 2. Superior Positions #1.....                                | 44 |
| 3. Superior Positions #2.....                                | 45 |
| 4. Superior Positions #3.....                                | 45 |
| C. Cover.....                                                | 45 |
| 1. Description.....                                          | 45 |
| 2. Types .....                                               | 45 |
| D. Forests .....                                             | 46 |
| 1. Dense forests.....                                        | 46 |
| 2. Light forests .....                                       | 47 |
| E. Rough Terrain.....                                        | 47 |
| F. Rivers.....                                               | 47 |
| 1. Types.....                                                | 47 |

|                                                            |    |
|------------------------------------------------------------|----|
| 2. Consequences .....                                      | 47 |
| IX. Hidden Movement & Losses .....                         | 48 |
| A. Hidden Movement .....                                   | 48 |
| 1. Markers.....                                            | 48 |
| 2. Off-the-board movement.....                             | 48 |
| B. Hidden Losses .....                                     | 49 |
| X. House to House Fighting and Movement .....              | 50 |
| A. Firing .....                                            | 50 |
| B. Melees .....                                            | 50 |
| C. Movement.....                                           | 51 |
| D. Destruction of a House .....                            | 52 |
| 1. Using artillery .....                                   | 52 |
| 2. With a mine .....                                       | 52 |
| 3. With fire.....                                          | 52 |
| XI. Obstruction, Construction, and Destruction .....       | 53 |
| A. Obstruction and Construction .....                      | 53 |
| 1. Chevaux de Frise .....                                  | 53 |
| 2. Abattis/Hedges .....                                    | 53 |
| 3. Hasty Earthworks.....                                   | 53 |
| 4. Improved Earthworks .....                               | 53 |
| 5. Formed Earthworks.....                                  | 53 |
| 6. Gabions .....                                           | 54 |
| 7. Redoubts .....                                          | 54 |
| 8. Pontoon Bridges .....                                   | 54 |
| 9. Bridge Repair.....                                      | 54 |
| 10. Filling in a Ford .....                                | 54 |
| B. Destruction .....                                       | 54 |
| 1. Destruction of Structures by Artillery.....             | 54 |
| 2. Mines .....                                             | 55 |
| 3. Fire.....                                               | 55 |
| 4. Clearing Trees .....                                    | 55 |
| XII. Campaign.....                                         | 56 |
| A. Introduction.....                                       | 56 |
| B. Sequence of Play .....                                  | 56 |
| C. The Map .....                                           | 56 |
| 1. Basics .....                                            | 56 |
| 2. Map hex legend (typical).....                           | 56 |
| 3. Terrain .....                                           | 56 |
| 4. Details.....                                            | 57 |
| D. Time .....                                              | 58 |
| E. Movement.....                                           | 58 |
| 1. Normal movement in hexes per turn are as follows: ..... | 58 |
| 2. Forced marches .....                                    | 58 |
| F. Attrition.....                                          | 59 |
| G. Supply .....                                            | 59 |

## I. Introduction

### A. A Rule Set for Napoleonic Warfare

This rule set is designed to simulate Napoleonic combat during the period 1800 to 1815. It can be used for earlier periods, or even hypothetical situations that could have occurred after Waterloo. Like any rule set this one has some difficulty accomplishing its goal: that of creating a realistic setting in which players may match their wits in a period long gone. In certain instances realism has had to suffer in order to enhance playability. We regret this expedient but accept it as a necessary evil inherent in any rule set.

These rules are designed primarily for tactical and (in a limited sense) grand tactical play. Grand tactical play requires considerable time and a strong working knowledge of the rules by most of the players.

Luck or chance is represented in these rules by the role of the dice. Circumstances that require a decision, such as a melee, are adjusted first for concrete factors, like troop quality and position, and then a dice roll further weights the results. Unless otherwise specified six-sided dice are used.

### B. Scales

#### 1. Castings

Each casting of a man (or cavalryman with horse) represents 12.5 actual persons. A pair of two castings (one point) represents 25 "real" men. A battalion of 25 points, therefore, represents 625 men. A point is the basic unit used in this rule set. Each casting of an artillery piece represents 2 actual artillery pieces.

#### 2. Distance

Distance is subject to two scales. For small arms and movement, 100 yards is represented by 10". For artillery and, more or less, visibility, 100 yards is represented by 4". This seeming contradiction is necessary as it allows a smaller playing field than would otherwise be required.

#### 3. Time

Each "turn" is equal to 30 seconds of real time. This time period is used because it is the minimum amount of time required for basically any unit to complete a firing sequence. Units that performed better are compensated by a higher quality of fire.

### C. Figures (Castings)

#### 1. Painting

All figures used in a battle must be painted. Where part of a unit is painted that part may participate but the rest is treated as if it did not exist.

#### 2. Mounting

(a) Infantry are mounted depending on their type (see **E.** below). Heavy infantry are mounted one company per stand<sup>1</sup> in two ranks. Light infantry are mounted four casting per stand in two ranks. True skirmishers are mounted two castings per stand. Command stands for heavy infantry generally include an officer, one or two standard bearers, and one or two drummers, usually in one rank. For light infantry or true skirmishers an officer and bugler are required, standard bearers are optional.

---

<sup>1</sup> A stand is the base to which the figures are glued.

(b) Heavy and medium cavalry are mounted one company per stand (generally 6 or 8 men) in two ranks. Light cavalry is mounted with 2, 3, or 4 men per stand in one rank. Generally, this amounts to two stands per company. Command stands for cavalry usually include an officer, standard bearer, and bugler.

(c) Artillery is mounted with anywhere from 4 to 8 figures per gun (depending on the caliber of the gun, see **Section V, Artillery**, below), one gun per stand.

(d) Mounted officers (Colonels to Generals) are mounted individually and labeled with their rank and unit for Colonels and regimental officers or rank and name for Generals.

## D. Troop Quality

The measure of troop quality in this rule set is called the Fighting Factor (FF). Fighting factors are used in all aspects of these rules, small arms, melee, morale, and, to a very limited extent, movement. When calculating any of the aforementioned the FF is used to help determine success. Of course, the higher FFs enjoy considerably more success than the lower ones. The same FFs are used for all different types of troops (infantry, cavalry, and artillery). The different Fighting Factors are described below:

### FF 1 - Untrained Militia

These troops have little or no training. For them close order maneuvering and small arms fire are difficult, if even possible. These men are often poorly equipped, for example they may carry pikes instead of muskets. Troops with a FF of 1 are almost more of a liability than an asset.

### FF 2 - Landwehr (Trained Militia)

One step up from the 1s, these troops have received some training and are usually better equipped. Landwehr often performed well and were used in the line of battle when necessary.

### FF 3 - Conscript Line

Conscript troops fit into three categories. First, they are FF 4s who have not yet received enough experience or training. Second, they are the weekend warrior types who served their country for limited periods each year or in emergency. Third, they are landwehr/militia with more experience or more training.

### FF 4 - Veteran Line

These are the backbone of most armies. Veterans are the standard troops of the day, used in the line of battle. Of limited esprit de corps they are not the stars, but are capable and steady.

### FF 5 - Crack Line

As the name implies these are veterans who have gone beyond the norm. Crack troops are more experienced, capable, and disciplined. Only the French, British, and Prussian line troops are typically crack line. For other nations crack troops are some of the elite troops.

### FF 6 - Elite

These troops are crack line or special status troops with even more élan and esprit de corps.

### FF 7 - Grenadier

FF 7 troops are the best units for many countries. They are virtually guard troops. Only exceptional units receive this status. These units are extremely capable and very proficient at all aspects of fighting.

## FF 8 - Guard

There are a very limited number of units that qualify for this honor. French middle guard, British, Russian, and Prussian guard troops are the only ones that typically qualify. Other special status guard troops may also qualify. These men are extremely steady, proficient, elite, and virtually unbreakable.

## FF 9 – Old Guard

A very limited number of French troops qualify as Old Guard status. Those regiments that qualify are the 1<sup>st</sup> and 2<sup>nd</sup> regiments of Foot Grenadiers and Chasseurs, the Horse Grenadiers, Gendarmes d'Elite, Horse Chasseurs, Mamalukes, and the 1<sup>st</sup> (or Polish) Lancer Regiment. These regiments were arguably the best of the Napoleonic period. Throughout the rules and charts, generally, FF 9 troops are included with FF 8 unless specifically mentioned.

The Fighting Factors and their assignment to the various units are based, in part, on Scott Bowden's "Empire" rule set. In some circumstances assignments under these rules deviate from those of Mr. Bowden.

## E. Troop Types

### 1. Infantry

- (a) Heavy infantry were the backbone of all the Napoleonic armies. As mentioned above they are distinguished from light infantry in that they are usually mounted with one company per stand. Heavy infantry fought shoulder to shoulder, therefore, they moved using stiff and inflexible formations. In combat, heavy infantry is most successful using massed volleys and close-order formations. They are most vulnerable when disorganized or when their flanks are exposed. See also section **III. Infantry**, below.
- (b) Light infantry generally had additional training in loose formations. Since, however, most light infantry fought in more or less close order, like the heavy infantry, most light infantry units do not receive the "true skirmisher" designation. Differences between light infantry and heavy infantry often include firepower, quality, and movement.
- (c) True skirmishers are those few units that were heavily trained in skirmisher formation fighting or who seldom, if ever, fought in close order. All light companies of heavy infantry battalions are true skirmishers. Other true skirmisher units are: French Chasseurs de Montagne or Tirailleurs du Po or Corse, British rifle battalions and Canadian light infantry, most jager units of any country (except Russia), and the Russian Finlandski Garde Carabinier. Additional units will be designated as necessary.

### 2. Cavalry

- (a) Heavy cavalry were the shock troops of the period. Not adept at maneuver and not particularly fast, their true purpose was to strike at the right time and place and overrun the enemy by sheer weight, called "shock action."
- (b) Medium cavalry were used as shock troops when necessary but were not as good at the task as the heavies. Medium cavalry can move quicker than heavy cavalry, and is more adept at outpost duties (screening and reconnaissance).
- (c) Light cavalry were occasionally used as shock troops, and with success, however, they are best at scouting and screening. Their speed and maneuverability make them particularly valuable in this role and operating on the flanks of the opponent.

## 4

### 3. Artillery

- (a) Foot artillery is designated as such because the gunners walk beside the guns. They, therefore, move more like infantry. Foot artillery usually had the heavier caliber guns.
- (b) Horse artillery mounted its gunners so that the whole battery could move quickly. The price of such a luxury is that horse artillery generally had smaller bore cannon and howitzers.
- (c) Siege artillery is the generic term for the big caliber guns used to reduce fortresses. They are powerful but move very slowly and take much longer to load. Because siege artillery was hard to come by, commanders never risked it in a non-siege operation. Its use is prohibited in all games unless siege activities of some kind are involved.

## F. The Playing Field

Play is done on green, cloth-covered tables, which may rest on the floor or be raised on legs or supports. Terrain (see section **VIII. Terrain**) is arranged on the table to represent the actual features of the ground. Buildings (see section **X. House to House Fighting**) represent 6 actual buildings (except for fortifications).

## G. Visibility

|                        | <u>Clear</u> | <u>Fog</u> | <u>Rain/Snow</u> | <u>Moonless Night</u> |
|------------------------|--------------|------------|------------------|-----------------------|
| 1. Open & Flat Country | 48"          | 12"        | 24"              | 8"                    |
| 2. Light Woods         | 10"          | 4"         | 6"               | 3"                    |
| 3. Dense Woods         | 4"           | 2"         | 3"               | 1"                    |

Also see sections **VIII. Terrain** and **IX. Hidden Movement**.

## H. Weather

Weather rules are optional, however, insofar as they affect the incendiary rules they should be used. Most games are assumed to occur on lovely June mornings with blue skies, moderate humidity, and temperatures in the high 70s. For exceptions use the following:

1. Decide the season.
2. Shake 2 dice for the conditions:

| <u>Spring</u> | <u>Summer</u> | <u>Fall</u> | <u>Winter</u> | <u>Condition</u> |
|---------------|---------------|-------------|---------------|------------------|
| 9 - 12        | 8 - 12        | 9 - 12      | 11 - 12       | Clear, no wind   |
| 5 - 8         | 4 - 7         | 6 - 8       | 9 - 10        | Clear, wind      |
| 4             | 3             | 3 - 5       | 7 - 8         | Fog, no wind     |
| 2 - 3         | 2             | 2 - 3       | 5 - 6         | Rain, wind       |
| -             | -             | -           | 2 - 4         | Snow, wind       |

3. Wind direction.

Throw one die to determine the direction from which the wind comes. Wind intensity is always moderate unless otherwise determined.

|         |   |   |   |   |         |
|---------|---|---|---|---|---------|
|         |   | 2 | 3 |   |         |
| (North) | 1 |   |   | 4 | (South) |
|         |   | 6 | 5 |   |         |

## I. The Role of the Umpire

The umpire's role is obviously one of judge and mediator. An umpire is necessary because the rules cannot possibly describe every situation. The umpire's rulings are final unless it can be shown that they differ from the rules. The umpire must be informed of all movement "off the board" (see section **IX. Hidden Movement**) and it is wise to discuss any special or unusual orders with the umpire in advance.

## J. Pre-game

Before a game begins certain determinations should be made:

1. Objectives stated and/or victory points allotted.
2. General orders written by each commander. These are not necessary but may contribute to victory points.
3. Determine weather conditions and visibility.
4. Rosters prepared for each unit. Rosters are used to keep track of losses.
5. Umpire alerted to off-the-board movement or unusual orders.

## K. Tactical Move Sequence

### 1. Write orders

Write orders for all units. Units without orders will be incapable of any activity. If a question arises later in the turn a player must be able to substantiate his movement.

### 2. Move

Both sides move simultaneously, according to the orders written. If troops are moving to contact movement may be done in steps. Check Pre-Melee Morale when closing to contact (see section **VI. Morale**).

### 3. Artillery fire

Artillery fire takes effect before all others. It is possible for artillery fire (and all fire) to be done at any point during the turn. When artillery fire is purposely done later in a turn it will not take affect before all others. Those points lost will only be excluded from that point in the turn sequence on.

### 4. Small arms fire

Calculate fire and mark losses on rosters, if any. Casualties from artillery hits may not fire; casualties from enemy small arms fire are considered to be lost simultaneously, unless the volleys obviously occur at different times during the turn. An example of a time when volleys may not occur simultaneously is when one unit has a fire if opportunity and another has an order to fire. The fire if opportunity is a reactionary order and therefore, generally, should come second.

### 5. Melee

Check Pre-Melee Morale before closing. Calculate melees, determine results, move according to results, mark losses.

## 6

### 6. Bonus move

Victors of melees may make their bonus (or breakthrough) move. Units, which have not fired to this point, may do so now if possible and if so ordered.

The following may occur at any point during the turn: morale check, artillery fire, small arms fire, movement by those units with orders so designating.

### **L. Grand Tactical Move**

The grand tactical move combines from 2 to 4 regular moves into one round. This is generally used at the beginning of a game to help bring units into action quickly. Grand tactical moves really may only be done when no one plans to make contact with the enemy. Artillery fire may be allowed during a grand tactical move.

## II. Command and Control

### A. Officers

#### 1. Mounted officers

- (a) Each player selects an officer, which represents that player's actual person on the battlefield. The officer should be of a rank commensurate with the player's responsibility in the game.
- (b) Each regiment should have at least one mounted officer present with it at all times during a battle (light infantry or true skirmishers needn't have an officer). This officer is necessary to initiate any offensive action. If a mounted officer is not available for a unit a substitute is acceptable. Multi-battalion regiments needn't have more than one mounted officer. Battalion-level officers are assumed to accompany their battalions.
- (c) When a mounted officer is lost all units under his command must check their morale (see **Chart #2** and section **VI. Morale**). If they pass they need not continue to suffer a morale check for this reason. If they do not pass they must continue to test their morale (with the same disadvantage, e.g. deducting for having lost an officer) until they do pass, or flee from the battle. In subsequent turns, when a unit must test for morale, it is assumed a replacement has been appointed. This is valid for all officer levels except the supreme commander at a game, be he Napoleon or a divisional general.
- (d) Mounted officers may be lost anytime they are subjected to fire or involved in a melee. For small arms fire the officer(s) must be within effective range, and in the line of fire. For artillery fire the officer must be within canister range. To eliminate a mounted officer you must shake a 1 or 12 on a 12-sided die or a 6 on a 6-sided die. If a unit fires with the sole purpose of hitting only a mounted officer (or scout) that unit must first obtain a hit (as if firing at skirmishers) and then may shake the 12-sided die to knock out the officer. In campaigns a die roll of 12 (with a 12-sided die) means the officer was killed. A roll of 1 means he was wounded and is out for this action only. Either way the morale effect on his troops is identical.
- (e) Mounted officers can be used to improve morale (how much depends on rank, see **Chart #2** and **Chart #3**) during a morale check. A maximum of two officers per unit may be used for this purpose, only one of which may be a general officer. The officers must be within the distances specified on **Chart #2** (or 8" if not specified) of the unit in order to affect its morale. An officer may not be used at the same time by two separate units.
- (f) When calculating a melee the presence of a mounted officer in the melee allows the player to add one to his dice roll. Only one mounted officer may be used regardless of the number of units involved. In order to gain this benefit the officer must place himself at risk in the melee. He can be killed as mentioned under (d) above. An officer does not affect the die roll in this way in the Pre-Melee Morale test.

#### 2. Command stands

- (a) Command stands represent the commissioned officers, non-commissioned officers, and musicians of a unit, consequently it is considered to be spread throughout the unit.
- (b) A command stand (CS) is not eliminated unless it is the only thing remaining from the unit. In a melee the flag may be taken if the opponent shakes a 6.

(c) Command stands may move through formed ranks without disrupting them. The command stand is considered part of the line if it is touching it, regardless of position in front or behind.

(d) Command stands may fire and/or participate in melees along with the rest of the regiment. As long as the command stand is touching the ranks involved in the melee it does not matter if the command stand is part of the line, in front of the line, or behind the line.

## B. Orders

### 1. General orders

If players so choose, general orders may be written before a game begins (see section **I. Introduction**). These are the orders from the commander in chief to each subordinate.

### 2. Tactical orders

Tactical orders are written at the beginning of each move (see section **I. Introduction**). These orders are absolutely essential and must be strictly followed. Players must display their orders to the umpire if the existence of those orders is in doubt.

## C. Organization

While most games are not big enough to really allow utilization of all the various command levels, every player should have a working knowledge of and implement to the fullest extent possible the organizations typically used by Napoleonic armies. Refer to the chart on the following page.

### 1. Battalion

The basic unit was the battalion, composed of anywhere from 200 to 1,500 men. Typically battalions were commanded by a Chef de Battalion (French) or a Major, Lt. Colonel, or Colonel for the other nationalities. The cavalry equivalent to a battalion was a squadron.

### 2. Regiment

A regiment consisted of one or more battalions (squadrons), and was typically commanded by a colonel.

### 3. Brigade

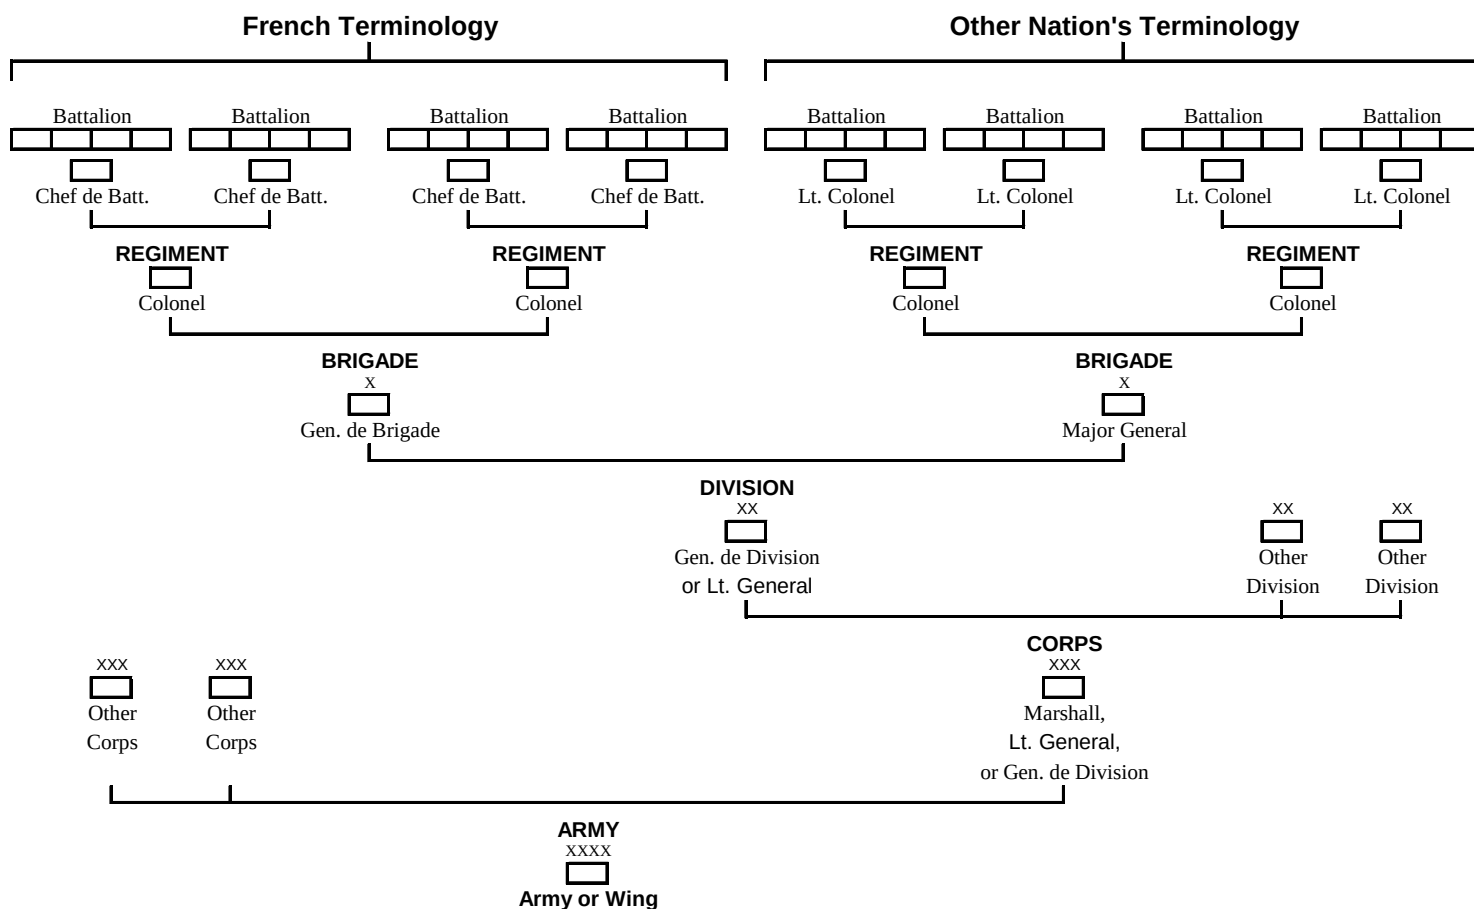

A brigade was typically commanded by a Colonel (often called a Brigadier) or Major General (General de Brigade for French) and consisted of several battalions or regiments. Commanders of brigades should have an ADC assigned to them.

### 4. Division

A Lieutenant General or Major General (General de Divisione for French) typically commanded a division. A division consisted of two or more brigades. Divisional commanders should have two ADCs assigned to them. Usually a division would have artillery assigned to it. Divisions should be assigned their own zone of responsibility on the battlefield.

### 5. Corps

The Corps was intended to be a miniature army having all arms and all staff functions consolidated under one command. A corps typically consisted of two or more infantry divisions and either a cavalry brigade or division. In the French army Marshals or senior Generals de Divisione commanded corps. In other armies, typically, senior Lt. Generals or full generals commanded corps. Corps commanders should have at least 2 ADCs assigned, a chief of staff, and an artillery officer. Corps should be assigned their own zone of responsibility on the battlefield.

## Description

The above chart is somewhat simplified from what would have occurred in reality, the goal being to give a graphic display of a fairly generic piece of an army. The terminology shown for “Other Nations” gives a good idea of the terms (in English) most armies used.

Each battalion shown has four companies. In reality battalions had from four to ten companies. Often two of the companies, the grenadier (or carabinier) and voltigeur (light or sometimes tirailleur), were elite.

The regiments shown have two battalions. This was often the case, but again some regiments had four or more battalions while others, particularly the British, typically had only one battalion from a regiment represented in the field.

In the British army the brigade consisted of three or four regiments (each of one battalion). Keep in mind that Divisions, and sometimes Brigades, would have artillery and other support units, such as engineers, attached. Cavalry units could be attached to infantry brigades, occasionally they were attached to a division. In the best organized armies cavalry units were usually attached to infantry corps. The reverse was not true, infantry would seldom be attached to a cavalry corps on a permanent basis.

### III. Infantry

#### A. Formations

##### 1. Line

##### (a) Close order

(1) Stands are placed side by side:

British infantry in close order line.

To eliminate confusion the stands should be touching, whenever possible, when organized and slightly irregular when disorganized. The line is an effective formation for volley fire, melee, and morale.

(2) A line is disorganized after a melee, when traversing rough terrain (forests, fields, plowed ground, steep hills), when falling back more than 1" in a turn (except when refusing a flank), after halting a charge (or any other time it moves a distance greater than 5" and subsequently halts, see (4) below). When disorganized the line suffers reduced effectiveness for fire, melee, and morale.

(3) Another unit may not pass through a close order infantry unit unless it specifically opens its companies (separating or even forming open order).

(4) A line may move 5" (ordinary step) or up to 10" (charge step). Any movement of a line beyond 5" will disorder the unit at some point. A line will be disordered after moving more than 5" if it halts, after a melee, or after charging for 3 consecutive turns (maximum consecutive number of turns it can charge) without a melee.

##### (b) Open order

(1) Stands are placed ½" to 1" apart. Open order is the formation for light infantry units (not true skirmishers) when screening. Heavy infantry may also form open order.

French light infantry in open order line, with a true skirmisher screen.

- (2) Open order offers a degree of safety from enemy small arms or artillery fire.
- (3) Open order reduces a unit's small arm's fire effectiveness (see **Chart #8**):
  - (i) Troops in open order get no first volley increment.
  - (ii) They must deduct for firing from open order.
  - (iii) The only exception is an ambush. When in ambush an open order (or skirmish order) infantry unit may execute one volley as if in close order. For all other purposes that unit is still considered to be in open order. An ambush requires 3 uninterrupted turns to prepare. The unit may not move during or after that time period or it will lose the advantage. An ambush must be set up in some kind of difficult terrain (forests, fields, behind abattis), not in the open in plain view of the enemy.
- (4) Units in open order are vulnerable to attack from enemy cavalry or close order infantry. Their effectiveness for morale purposes is also diminished (see **Charts #2, #3, and #4**). An ambush does not improve an open order unit's effectiveness in melee or morale.
- (5) Open order troops may not screen cavalry unless the cavalry is at least 12" behind the screen.
- (6) Light infantry mounted two per stand should be placed so that two stands are touching in order to differentiate from skirmish formation.
- (7) Troops in open order are subject to disorder just as if they were in close order. The penalty for disorder is added to that for open order.
- (8) Formed or Open order cavalry may maneuver around or through an open order infantry unit provided there is space between the stands. Open order infantry units may pass through each other.

## 2. Column

## (a) Column of Route

Italian light infantry in column of route, with a true skirmisher screen.

- (1) Typical formation for moving troops.
- (2) One company width.
- (3) Stands are spaced to allow a face to the flank.
- (4) Treated as an open order formation.
- (5) One point per stand may fire to the flank.
- (6) Cannot receive column-charge increment, but opponent receives open-order increment (see **Chart #4**).
- (7) A column of route may move 6" (ordinary step) or 8" (quick step). The column will not be disordered by quick step until it has had either contact with an enemy or moved 5 consecutive turns using the quick step, whichever occurs sooner.

## (b) Column of Attack

Prussian infantry in column of attack.

- (1) Used to move a mass of men quickly, or to break through an opponent's defense.
- (2) Generally 2 or 3 company width, no space between stands.

- (3) Vulnerable to artillery fire (see **Chart #9**).
- (4) Requires additional time to change to or from this formation (see **Chart #1**).
- (5) If the column halts the front companies may fire forward and/or one point per stand may fire to the flank.
- (6) Receives column charge increment.
- (7) May form a closed square in  $\frac{1}{2}$  turn. A closed square can only fire from the front. In melees it receives the same increment as a regular square (see **Chart #4**). In a melee, the points obtained from counting the figures from the side companies are doubled.
- (8) Shattered companies in front may peel off and reform behind the column (provided there is room).
- (9) A column of attack may move up to 8" (ordinary or quick step). The column will be disorganized after contact with an enemy or after 5 consecutive turns of movement at the quick step.
- (10) A column of attack must halt when the lead companies are defeated in a melee or when the column fails to pass a morale test (or the lead battalion fails to pass the test in a multi-battalion column). A neighboring column needn't halt unless it is touching the column in question.

### 3. Square

British infantry in square.

- (a) Stands are placed so they touch and face outward.
- (b) Austrian Battalion Masse (1 or 2 company front) looks like an attack column but can also be treated as a closed square. In attack it gets column attack increment.

- (c) Forming a square (or Battalion Masse for Austrians) is done according to **Chart #1** (generally 2 turns). A square is a special formation, which requires that the unit be tightly knit together. Just placing a battalion so that its sides face out does not necessarily create a square. In order to receive square increment the unit must take the time required to form a square. If a square is formed of more than one battalion add one turn for each additional battalion integrated into the square.
- (d) A square may move at any speed applicable to a line if the rear rank faces forward, otherwise it moves 2" per turn (see qualifying statements below). When the rear rank is faced forward it is vulnerable to attack. It takes ½ turn to turn the rear companies around.
  - (1) Can move 5" per turn, without disordering, for 3 consecutive turns.
  - (2) Can move 8" in one turn but will be disordered at the beginning of the next turn (the square would not be disordered in a melee occurring in that turn).
- (e) A square receives line-attack increment when it charges.
- (f) A square is vulnerable to artillery and musket fire.
- (g) A square receives square increment in any defensive melee (see **Chart #4**).
- (h) A square can be breached if it loses 6 points on one face of the square to either artillery or small arms fire in the same ½ turn. This creates a hole into which cavalry can rush. The number of cavalry points that can rush in is always the number points of loss to the square (still in the same ½ turn) less 2.
  - (1) If the square has a reserve (at least 1 company unengaged and) inside the square the reserve can plug a breach immediately. A single company in reserve can only plug one breach.
  - (2) If no reserve exists the square can reinforce itself in ½ turn (see below). If the cavalry enter the square before it can reinforce itself then: (i) the square must shake for morale (without the additive factor of a square and with the threat of a rear attack). If it passes morale (result better than rout) then, (ii) a small melee occurs inside the square in which the square gets square increment and the cavalry gets rear-attack increment.
- (i) A square can reinforce itself from a disengaged face after a melee. The reinforcement cannot bring the previously engaged face (or faces) back to a strength that is greater than ¼ (per face) of the strength of the entire square.
- (j) A square is broken if: (1) losses are so great that the square loses its integrity (somewhere around 70%), (2) the square loses a melee that results in a rout, or (3) the square has a morale test, for any reason, which results in a rout.
- (k) Squares offer advantages for fire, melee, and morale.
- (l) An occupied wall or building may provide one or more sides to the square.
- (m) As mentioned in section 2. above, an attack column can form a closed square in ½ turn. While forming the closed square the front companies may continue to fire. During and after the formation of a closed square the sides and rear may not fire. The closed square then melees like other squares, except that points counted from the "sides" of the column are doubled. While in this formation it may not move faster than 2" per turn.

- (n) Skirmishers may form a rally square. This formation does not get square increment in a melee (only “line defending”). It is formed when skirmishers, threatened by cavalry, run together and are able to get 6 points to touch. The rally square may not fire during that turn. It is not vulnerable to artillery like a square, but instead like other close order formations.

#### 4. Skirmish

This formation may only be utilized by “true skirmishers” as defined above (section I. **Introduction**).

##### (a) Functions

- (1) Forms a visual screen beyond which infantry are masked or screened (see section IX. **Hidden Movement**). To screen, the skirmisher's stands must be ½” to 1” apart.
- (2) Protects the skirmishers because of the difficulty of obtaining hits. Protects the screened unit because the skirmish line obscures the target (see **Charts #8 & #9**).
- (3) If a skirmish screen is eliminated the remaining hits are taken on the unit previously screened. That unit may not fire if the skirmishers have fired that turn.
- (4) Skirmishers masking a unit may pull back and form a third rank for that unit in ½ move. To do so the unit must be halted. The line may move and fire as normal with the skirmishers attached as the third rank. The unit may charge while the skirmishers are attached, but will still only be able to include two ranks in the melee.
- (5) Skirmishers may fire up to two ranks deep and 360 degrees.
- (6) Harasses enemy if close enough to engage in small arms fire.
- (7) Skirmishers may form a rally square. If attacked by cavalry skirmishers may try to “clump” together to protect themselves, no order is required. If the skirmishers are able to get 6 points together they have a rally square. This square may not fire and if engaged in a melee it fights with the increment of a line defending (not that of a square). If less than 6 points can touch before the cavalry arrives they are overrun like skirmishers. Artillery fires at a rally square like at any other close order troops.
- (8) Skirmishers are generally allowed reaction-type moves without penalty, such as fleeing when threatened or firing without orders.

##### (b) Limitations

- (1) Not able to volley fire or receive first volley increment. Only 50% of those points that could fire (are within range, etc.) may actually fire. Rifles may fire only 33%. No option exists to hold fire one turn and fire 100% the following turn. The only exception is an ambush where a unit in open order or skirmish order may fire as if in close order (does not melee or have morale effect of close order). To set up an ambush a unit must prepare for 3 uninterrupted turns. The unit may not move and for all other purposes is treated as in skirmish order.
- (2) Units behind a skirmish screen may not fire through it. However, skirmishers if within 2” of a unit may lie down, allowing that unit to fire over them.
- (3) Skirmishers struck by formed or open order cavalry are automatically ridden down. If struck by infantry the melee must be calculated (use **Chart #4**). In both circumstances calculation of

the Pre-Melee Morale (see Section **VI. Morale**) is not required unless the skirmishers attempt to stand their ground.

(4) Skirmishers fleeing may fire only if in good morale (they are fleeing voluntarily). If they are fleeing a distance greater than 10" they may not fire

(5) Infantry screens (open or skirmish order) may only screen cavalry if the cavalry is at least 12" behind the infantry screen.

## 5. Changing Formation

Changing formation was a slow and complicated process. All changes take one full turn to complete, the exceptions being those on **Chart #1**. During any change of formation the only part of a unit that may fire is the portion, if any, which has not had to move at all. If struck the unit is considered disorganized. For melee-morale purposes it is considered disorganized (in addition to open or skirmish order if the unit was not in close order prior to commencing to change formation). Except where mentioned above, no part of a unit may participate in any activity while the unit changes formation unless that part is obviously detached and independent.

## B. Actions

### 1. Small arms

#### (a) Musket Volley fire

(1) This is the typical fire by close order troops. The effect is calculated using **Chart #8** (see the instructions to that chart).

(2) Fire is done by the first two ranks of a line (or column), an exception being when a skirmisher screen is formed in front as a third rank (see section **A.** above).

(3) Troops must face in the direction of fire. The field of fire extends 22½ degrees to either side of a line perpendicular to the front of the stand (a 45 degree arc).

(4) A unit may not fire through a friendly unit. A unit may fire over a friendly unit if the firing unit is elevated adequately to have a direct line to the target plus a cushion space over the heads of the friendly unit (approximately 2", and the elevated unit is within 6" of the lower unit, or in the upper story of a building immediately behind the forward unit), otherwise, hits will be taken equally on friend and foe. The volley of a unit behind and to the side of another unit may not come closer to the front unit than 2".

(5) A unit may not fire over the same piece of ground over which a friendly unit had previously fired, during the same turn. For example, unit A fires a volley. During that turn it is entirely eliminated by an opposing unit, which fired into it. Unit B, initially behind Unit A, now has a clear field of fire, however, it may not fire this turn. The only exception is where one unit is elevated and can fire over the heads of the other unit.

(6) A unit may fire and advance (5" for a line or 6" for a column) or advance and fire without disordering or needing to stop to reload.

(7) A unit may fire and then charge step a full distance. If it charges first it may halt to fire, but until it reforms it does so disordered. If a unit has fired then charged, after charging, and possibly meleeing, it may not fire until it has had ½ turn to reload.

(8) Fire may take place at any time during a turn when a unit passes through an opponent's field of fire, provided the unit firing has an order so allowing.

(9) A unit with an order to “fire if opportunity” may generally fire in the first half of a turn. However, “fire if opportunity” is a reaction order and will occur, where applicable, after the fire (and effects thereof) of friendly and enemy units with a positive fire order.

(10) A unit, when faced by cavalry or charging infantry 16" away, may be forced to test for premature fire. This is done using **Chart #2**. If a unit passes its test for premature fire, it may hold its fire until the last possible moment if it chooses.

(b) Musket Fire from open order

(1) Fire is as under Volley fire (above), except that the volley is less effective (hits reduced 30% see **Chart #8**). No first volley advantage is allowed to units in open (or skirmish) order. The only exception is where the unit has set up an ambush.

(c) Fire from Skirmish order

(1) Only 50% (33% for rifles) of the points which can fire, under close order rules, are counted when calculating fire from a unit in skirmish formation. This is due to the fact that the men are as concerned about dodging, running, and taking cover as they are about firing. The only exception, as mentioned above, is an ambush.

(2) The field of fire for skirmishers is 360 degrees.

(3) Skirmishers may only fire two ranks deep.

(4) Skirmishers fleeing may fire only if they move less than 10" and they have good morale. They may not fire if they are fleeing as a direct result of failing to pass a Pre-Melee Morale test or having lost a melee.

(d) Rifle Fire

(1) Calculated similar to musket fire except it uses the separate Rifle increments and decrements and FF column on **Chart #8**.

(2) Rifles take 2 turns to load. When in close order, rifles fire every other turn. If the commander so chooses, however, he may hold fire for one turn and therefore be able to fire the entire unit together. If he does this he will have no loaded rifles the following turn. When in skirmish formation rifles may only fire every 3rd turn (33% per turn). When in open order rifles may hold fire for a turn, however, the OO decrement (20% for rifles) will apply.

## 2. Movement

Movement is done per **Chart #1**.

(a) The advance: On the chart an ordinary advance is done using the "ordinary step" for line or column of route for column.

(b) Facing: Turning a stand 180 degrees requires ½ turn when in close order. For skirmishers or infantry in open order it is instantaneous.

(c) Falling back: A backward step of 1" per turn is allowed without disordering the formation. Movement of the full 2" will disorder the unit.

(d) Refuse a flank: This maneuver draws back (refuses) one or two companies (three if small) on one of the flanks of a line into a position perpendicular to the rest of the line. The line will then look something like an L, with companies facing in two directions. Refusing a flank takes ½ turn to complete and the

companies being refused are disordered while doing so. The refused companies may fire before or after but not during the maneuver.

(e) Lateral move: A lateral move of 1" per turn for formed infantry is allowed. An oblique advance of 3" per turn is allowed.

(f) Reforming:

(1) Reforming causes a disorganized close order unit to be "organized" again, or a unit in open order or skirmisher formation to form in close order. The time required to perform this task depends on the formation currently used. Use the change of formation rates on **Chart #1** to determine the required time.

(2) If a unit in open order is disordered (for example, when trying to move in rough terrain) that unit reforms (to ordered open order) in ½ turn.

(g) Obstructions: Formed infantry have difficulty negotiating obstacles. Generally, a unit in line can climb over a wall (or fence or hedge) up to 1" high during a turn. The unit is disordered when it arrives at the other side. Walls up to 1½" tall may be traversed in two turns. Higher walls need ladders or other tools, see section **XI. Obstruction**, for more information. A unit in column will take one more turn than a line to entirely pass over an obstacle. Troops in open order or skirmisher formation may pass these obstacles in ½ the time.

(h) Breaking and running:

(1) Occasionally it is in the best interest of a unit to break formation and run.

(2) The unit may move 10".

(3) Breaking and running disorders a unit. Further, for morale purposes the unit must be treated as in retreat. When the unit attempts to halt it must pass a morale test as with a retreating unit.

(4) As a target this unit, if previously in close order, is still treated as close order for the first ½ turn of its withdrawal.

(5) As mentioned previously, skirmishers may fire if they move less than 10" and are not fleeing as the result of a failure to pass a morale test. All other units may not fire.

### 3. The charge

(a) See **Chart #1** for speed. Charge increment is only obtained if the unit has moved at, at least, the quick step.

(b) Sequence

(1) When the movement sequence begins the charging unit moves ½ of its move. For infantry the Pre-Melee Morale test is calculated when the units involved are 8" apart (see section **VI. Morale**).

(2) Units with a charge if opportunity order may only move ½ of a full charge move (during the second half of the move). If a Pre-Melee Morale test occurs during the first half of the turn those units are not at that point charging and will not receive the charge increment.

(3) Artillery fire and small arms fire take place for all units (including any units being charged which passed their Pre-Melee Morale). Effects are deducted from the charging unit.

(4) The unit makes the second half of its turn (or if charge if opportunity it moves its one-half). If there is contact then a melee is calculated (see section **VII. Melee** and **Chart #5** for more information).

(c) Line charge

(1) Flanks overlapping the enemy may wrap around and be included in the calculation of the melee. Elements of the same unit that have wrapped around do not receive the advantages of a flank or rear attack. In order to receive those benefits a separate unit must strike the flank or rear of the opponent.

(2) A unit may fire and then charge, or halt its charge and fire, but it may not fire while charging. If a unit halts a charge to fire it does so disordered unless it takes the time to reform.

(d) Column charge

(1) A charging column must be at least 2 or 3 companies wide, or it does not receive the increment of a column charge.

(2) A charging column may swerve for any reason as much as 22½ degrees to either side from its original direction of attack.

(3) An attacking column comprising more than one battalion may separate and diverge to different targets provided they are within the 45 degree arc allowed a column attack.

(4) An attack column whose leading companies are depleted by enemy fire may move them to the rear of the column to reform without suffering any disadvantage.

(5) A column thrown back or otherwise attempting to retrograde move will become disorganized.

(6) A column may be halted for any of the following reasons: defeated by the enemy from the front, hit in the flank by cavalry or infantry, or loss of 50% of its strength. It may continue the following turn if morale is adequate.

(e) Infantry charging cavalry: Infantry may only charge cavalry if the cavalry is halted, or in some other way disadvantaged, or the infantry is able to hit the cavalry in the flank or rear. In these cases the infantry will get line attack increment in the melee. In any other circumstances the infantry gets “line defending” increment. An overlapping infantry line, attacked by cavalry, may only wrap contiguous points (of the same unit) around the cavalry as allowed in section **VII. Melee** (one company up to a maximum of 2 points per flank). A separate unit, or separated points of the same unit, may not join the melee by attacking the cavalry unit (regardless of their orders) in the first turn of the melee. If the melee continues on the same ground, for example the result was a tie or forced back for either cavalry or infantry and the melee continues into a second turn, then adjacent units can charge the now halted, or otherwise disadvantaged cavalry.

## IV. Cavalry

### A. Formations

#### 1. Close order/Line

Austrian heavy cavalry in line, with squadrons separated.

(a) In a line the stands are placed side by side. To eliminate confusion the stands should be touching when organized and irregular when disorganized. Most cavalry operations are carried out in close order. The line is an effective formation for charging and morale.

(b) A line (or cavalry in general) is disorganized after a melee, after 2 turns of galloping, after halting a gallop charge, when traversing rough terrain (forests, fields, plowed ground, high hills), or when falling back more than 2" in a turn. When disorganized the line suffers reduced melee and morale effectiveness.

#### 2. Open order (Line or Column)

Stands are placed  $\frac{1}{2}$ " to 1" apart. Open order offers safety from enemy small arms or artillery fire. Open order is the formation for light cavalry units when screening. Open order reduces a unit's effectiveness in melee or morale. Units so ordered are vulnerable to attack from enemy cavalry.

#### 3. Skirmish

Light cavalry units whose component stands are widely separated (more than 1" apart) are treated as if in skirmish formation.

#### 4. Column

French light cavalry in column, with squadrons separated.

Cavalry typically used columns to move from one location to another. Column charges were occasionally used and are allowed. Cavalry attacking by column receives the usual line-charge increment in the melee.

## B. Actions

### 1. Movement

(a) Movement is done per **Chart #1**.

(b) The advance: On the chart an ordinary advance is done using the "walk".

(c) Falling back: A backward move of 2" per turn is allowed without disordering the formation. Movement up to 4" is allowed but it disorders the unit.

(d) Lateral move: A lateral move of 1" per turn for cavalry is allowed.

(e) Trot/Gallop: These are the charge moves available to cavalry units. Both moves receive the full charge increment. In order to gallop a unit must first trot for a move. During its trot move a unit must cover at least 80% of the distance of a trot move. If it does not do this in a turn, then in the subsequent turn it will need to complete its trot distance before moving the remainder of that turn at a gallop, e.g.  $\frac{1}{2}$  of the move at trot speed and the other half at gallop speed. For example, a light cavalry unit trots 17" in turn 1 and desires to gallop in turn 2. In a turn immediately preceding a gallop move it must cover at least 20" (80% of a 25" trot move) in order to be able to gallop the full distance in a following turn. In this example the light cavalry unit may only move 30" in the second turn ( $\frac{1}{2}$  of the turn at the trot (12  $\frac{1}{2}$ ") and  $\frac{1}{2}$  of the turn at the gallop (17  $\frac{1}{2}$ ")).

(f) Reforming: Reforming causes a disorganized close or open order unit to be "organized" again, or a unit in open order or skirmish formation to form in close order. The time required to perform this task depends on whether the unit is light, medium, or heavy cavalry. Use the change of formation rates on **Chart #1** to determine the required time.

(g) Fleeing/Dispersing: Light cavalry may break formation instantly and run a full trot move. Heavy and medium cavalry require  $\frac{1}{2}$  turn to break their formation, afterwards they may run  $\frac{1}{2}$  turn. For all types of cavalry, if they were in close order at the end of the prior turn they may still be fired at as if in close order for the first half of the turn in which they flee or disperse. The distances they may flee are limited depending on how much movement they may already have made that turn. Any unit fleeing or dispersing in this way is disordered. Further, for morale purposes the unit must be treated as in retreat.

(h) Jumping: Light cavalry may jump obstacles 1" high. Heavy and medium cavalry may jump obstacles  $\frac{1}{2}$ " high. Jumping an obstacle disorders a unit whether galloping or walking.

### 2. Charge

(a) See **Chart #1** for speed. Both trot and gallop charge speeds receive the full charge increment in a melee.

#### (b) Sequence

(1) When the movement sequence begins the charging unit moves  $\frac{1}{2}$  of its move. The Pre-Melee Morale test is performed when the charging unit is 16" away from the target (see section **VI. Morale**).

(2) Artillery fire and small arms fire take place for all units (including any units being charged which passed their Pre-Melee Morale). Effects are deducted from the charging unit.

(3) The unit moves the second half of its turn. If there is contact then a melee is calculated (see section **VII. Melee**, for more information).

(4) Units with a charge if opportunity order may only move  $\frac{1}{2}$  of their charge move (during the second half of the turn). If a Pre-Melee Morale test occurs during the first half of the turn those units were not charging and do not get the additional increment of a charging unit.

(c) Particulars

(1) Cavalry must charge at least 6" in order to obtain their "shock" increment. A cavalry unit receives a bonus if its opponent in a melee either is standing still or has charged less than 6" (see **Chart #4**).

(2) Cavalry may swerve only minimally (2" for heavy and medium cavalry, 4" for light) unless the squadrons are spaced apart. When at the trot, with the squadrons spaced apart, medium and heavy cavalry may swerve up to 10" to either side of straight ahead, light cavalry may swerve as much as 18" to either side (less if less than the full move distance remains to the target). To perform this calculation measure the full charge move (or the portion remaining) straight ahead, and then measure to either side of this line the amount designated above. The cavalry may hit any target within the triangle thus created. When at the gallop (squadrons still separate) medium and heavy cavalry may swerve up to 6" to either side and light cavalry may swerve up to 18". For cavalry units in open order add 2" to all of the above distances for heavy or medium cavalry and add 4" for light cavalry.

(3) A cavalry unit having once started a charge may not change formation or form up while en route to the target. Separately formed squadrons may modify their relative positions while en route to the target.

(4) Friendly scouts or skirmishers who are caught up in a charge may complete the charge to the opponent with the formed troops. In the melee, however, they may only contribute their points; they are granted no increment.

### 3. Melee

(a) Overlap: A cavalry unit whose line overlaps the enemy may wrap around and include those extra points in the calculation of the melee. Elements of the same unit, however, that have wrapped do not receive the advantages of a flank or rear attack. In order to receive those benefits a separate unit must strike the flank or rear of the opponent.

(b) Lancers: Lancers are granted an additional 20% increment in a melee (including, potentially, any bonus move melee). For any melee (against cavalry) thereafter in which the lancer unit had no opportunity to break contact they must subtract 20%. In forced back situations where the melee continues the lancers receive neither increment nor decrement.

(c) Disordered:

(1) Cavalry attacked while standing still, disordered, or changing formation are treated as disorganized and an additional increment goes to the attacker (these increments are potentially additive).

(2) Cavalry attacking an infantry or cavalry unit in open or skirmish order receive the additional increment allowed to units in a melee with an opponent so formed. Infantry skirmishers, however, are immediately ridden over, which does not count as a melee. In this case the cavalry lose one point for every ten lost to the skirmishers.

(3) A melee, two turns of gallop, halting a charge, rough terrain, or a forest disorganizes cavalry. Any melee fought while disorganized rewards the opponent. The disordered cavalry unit will regain full effectiveness when it forms up (see **Chart #1** for required time).

(4) Skirmishing cavalry, or scouts, which are caught up in a charge may participate in the charge and melee but only contribute their points. They are granted no increment.

(d) Running melee: Occurs when one side retreats or routs following contact and the other side elects to continue the melee (and can maintain contact). This counts as the bonus move.

(e) Retreat or rout: A cavalry unit retreating or routing without a clear path away from the enemy will pass through its supports and disorder them. The supports or other rearward units must have sufficient space between them to allow the cavalry to pass.

#### 4. Pursuit

(a) Retreat: A retreating unit is disorganized. If struck it may melee with the rear or flank attack, and opponent disorganized, advantages (where applicable) going to the attacker.

(b) Rout: A routing unit (or otherwise fleeing unit) if struck does not have the chance to melee it is simply "cut down" by the pursuing cavalry. All stands touched are automatically removed. As each cavalry stand touches one fleeing stand the "touch" is considered a melee and the cavalry stand may bonus move and strike one more fleeing stand (unless the pursuit is already part of a bonus move). The pursuer loses one point for every ten (10) he eliminates.

#### 5. Recall

(a) Light cavalry: Light cavalry in the act of charging (at the gallop) may be recalled after ½ of their charge if they pass a morale test. Bad morale (forced back or worse) means the unit is not disciplined enough to be recalled; it must complete the charge to the target. British cavalry (except KGL troops) may not be recalled. A failed melee-morale test takes precedence over any inability to recall. The other ½ of the move is used to halt and/or turn around; the unit is disordered until it reforms.

(b) Heavy or medium cavalry: Heavy and medium cavalry must complete the first full turn of their charge (if at the gallop). At the end of that turn they may be recalled if morale is good. If successfully recalled the first half of the next turn is used to halt and/or turn around. The unit is disordered until it reforms. British cavalry (KGL excepted) may not be recalled.

(c) Trot: A trotting unit may be recalled at any time unless the target is within 8". The above restrictions only apply when galloping to a target.

#### 6. Firing from the saddle

Cavalry firing their carbines from the saddle do so at a decrement of 50% (20% for the Kentucky Mounted Rifles and Austrian Sarassaner). All cavalry must be stationary to fire (with effect) except the Kentucky rifles and Sarassaner. Those units may fire on the move (speeds up to a trot) at a decrement of 50%.

#### 7. Dismounting

Dismounting requires ½ turn for light and medium cavalry, 1 turn for heavy cavalry, during which they may accomplish no other task. Cavalry fighting dismounted are treated as having a fighting factor two steps lower than usual (not to exceed 5) for heavy cavalry, and 1 step lower than usual (not to exceed 5) for light and medium cavalry. Kentucky mounted rifles continue to fight dismounted at their usual fighting factor. One man in five (20%) must remain in the rear to hold the horses.

**8. Spiking artillery pieces**

Spiking an artillery piece occupies 2 points of cavalry, per gun, for one full turn. This includes any mounting and dismounting that needs to be done.

## V. Artillery

### A. Types

#### 1. Cannon

Cannon is the term used to describe the field, siege, or naval artillery pieces that fired over a relatively flat trajectory. Usually these pieces are categorized by the weight of the shot they fire. Cannon may not fire over the heads of friendly troops unless the cannon or target is elevated.

##### (a) Weight

(1) The smaller weight guns, 3, 4, or 6 pound, fired the smallest ball over the least distance. The medium sized pieces, 8 or 9 pounders fired a larger ball with an increased range and striking power. The largest field piece was the 12 pounder. This gun had the longest range for a non-siege gun. See **Chart #7** for ranges.

(2) All of the above guns, except the 12 pounder, may move  $\frac{1}{2}$  their walk distance and still fire. If a 12 pounder is moved (including swiveled more than 45 degrees or manhandled more than 1") it may not fire that turn. The rules for horse artillery are different, see section 7 below.

##### (b) Types of shot

(1) Solid shot, also known as round shot, was the most commonly used projectile of the Napoleonic wars. It is particularly useful against formed bodies of men and structures. It may be heated for use against ships ("hot shot").

(2) Canister is packets of small balls fired together with an effect something like that of a shotgun. For these rules canister and grape shot are synonymous. Canister has a shorter range than round shot but has an increased probability of obtaining a hit. However, canister does not carry as far into a deep formation. Therefore, it is less effective against a target arrayed in depth.

(3) Bar or chain shot were used primarily by naval vessels. Bar and chain shot were devastating to the rigging and masts of a ship. Seldom used on land, these rules make no provision for their use as anti-personnel or anti-structure. See **Chart #11** for their use against ships.

(4) Carcasses were special incendiary projectiles (actually oily inflammatory material) used to set fire to buildings or fields. Carcasses improve the chances of starting a fire (see **Chart #10**). Each gun may fire only three carcasses during a game. Carcasses reduce the range of the gun by one half.

(5) Spherical case shot was invented by the British and used by them during the Napoleonic wars. It was an explosive shell fired through a cannon rather than a howitzer. To simulate its effect in these rules use cannon range and howitzer shell results (**Charts #7** and **#9**).

#### 2. Howitzers

(a) Howitzers fired an explosive shell in a high trajectory arc. Howitzers, unlike cannon, may fire over the heads of friendly troops. In order to do so they must be at least 4" behind them.

(b) When firing howitzers the player must always throw a single die first to determine if the shell in fact does explode. If the die roll results in a one (1) the shell was a dud and no effect results. This applies to all explosive shells (mortars, rockets, and spherical case).

## (c) Weight/Bore

(1) Howitzers are categorized by either the weight (7, 10, 18, 24 pdr.) or width (5½", 6", or 8") of shell used. As with the cannon the smaller weight or bore howitzers have a shorter range.

(2) As with cannon all of the howitzers, except the 8" (24 pdr.), which suffers the same restrictions as a 12 pdr. cannon, may move ½ of their walk distance and fire.

## (d) Types of Shot

(1) All howitzers fired an explosive shell. When firing a shell use the Howitzer columns of **Chart #9**. Since the fuses then in use were quite primitive a die must be thrown before calculating hits to see if the shell did actually explode. A one means the shell was a dud.

(2) Canister may be fired from a howitzer in the same manner as from a cannon.

(3) Carcasses fired from a howitzer are under the same restrictions as those fired from cannon.

## 3. Siege cannon

Siege artillery were large bore cannon (18 pdr. or greater) used primarily against structures (fortifications etc.) to knock down walls. Siege guns fired slowly and were much heavier and more difficult to maneuver than normal field artillery and therefore fire every second or third turn depending on size (see **Chart #7** for ranges and rates of fire). If a siege gun is swiveled more than 45 degrees or manhandled more than 1" during a turn it can accomplish no other task during that turn and will need an additional turn to load.

## 4. Mortars

Large-bore, short-barreled howitzers seated on heavy wooden beds. Mortars fire at a much longer range and higher arc than regular howitzers (see **Chart #7** for ranges). Used primarily in siege warfare as an anti-personnel device. They were not as effective against fortifications. Move and fire limitations that apply to siege cannon also apply to mortars.

## 5. Garrison and Ship's cannon

These pieces are distinguished because they are mounted on garrison trucks. Use the usual artillery charts when firing these pieces.

## 6. Rockets

(a) Experimentally used by the British, rockets had an explosive warhead attached to a long wooden shaft. They were highly inaccurate (can in fact cause damage to friendly units) but quite incendiary and morale threatening to inexperienced troops.

(b) Rockets fire two times per turn. When firing rockets use the rocket columns on **Chart #9**. Please note that die rolls of 2 or (when modified) 1 result in a loss to the nearest friendly unit. Use **Chart #7** for ranges.

(c) All troops must shake for morale at a minus 1 (see **Chart #2**) when under fire from rockets. When a friendly unit is hit it must also shake for morale.

## 7. Foot Artillery and Horse Artillery

## (a) Foot artillery

(1) So designated because the gunners walked beside the limbers. Foot artillery batteries generally include heavier guns (up to 12 pdr., but 6 pdrs. were the most common).

(2) Foot artillery may fire every turn provided it moves no more than  $\frac{1}{2}$  the usual walk distance. Guns that trot may not fire that turn. 12 pounder guns may not move more than 1" (manhandled) or be swiveled more than 45 degrees and still fire that turn.

(b) Horse artillery

(1) The gunners of horse artillery batteries are mounted and the guns are pulled by more horses than foot artillery, allowing them to move much quicker. Horse artillery batteries are armed with smaller pieces (generally 4 and 6 pounders though the British often used 9 pounders).

(2) Horse artillery may fire every turn provided it moves no more than  $\frac{1}{2}$  its walk or trot distance. When threatened, horse artillery may fire at the beginning of the turn and retreat a full trot move.

## B. The Crew

### 1. Mounting

Each gun represents two actual pieces. Every two men (castings) represent 25 actual men (one point). Unlike for infantry or cavalry, the number of points in an artillery crew is determined by the size of the gun, irrespective of the number of figures on the stand. For 9 and 12 pound cannon (and  $5\frac{1}{2}$ " and greater howitzers) the crews are 3 points. For smaller cannon and howitzers the crews are 2 points. For 18 and 24 pound cannon (and 9" to 11" mortars) the crews are 4 points. For larger cannon or mortars the crews must be 5 points. The stand to which an artillery piece is attached represents the space required to serve two artillery pieces and may not be infringed upon (overlapped).

### 2. Crew points required to fire

(a) For all guns that normally may fire every turn (12 pounder and 8" howitzer included if not moved), at least 2 points are required to continue to fire every turn. One point may fire every other turn.

(b) For all guns that normally fire every other turn, at least 3 points are required to fire every other turn as normal. Two points may fire the gun every third turn. One point may not fire the gun. These same rules apply to guns that normally fire every third turn only the time period is increased by one turn.

### 3. Small arms

The player may elect to have his artillerymen fire their small arms instead of their artillery pieces. They may not do both in the same turn. If attacked the artillery crew may fire and melee in the same turn (if it passes the Pre-Melee Morale test), but they melee as disorganized. An artillery crew melees from the open order position unless it takes the time to form up. The crew may not fire the gun or small arms while forming.

### 4. As infantry

If a crew's gun is destroyed (or for any other reason) an artillery crew may act as light infantry (not true skirmishers). The space occupied by their stand no longer represents the actual space required by those men. They maintain their same fighting factor. Artillerymen servicing their guns are treated as open order infantry.

### 5. Melee

In a melee, artillerymen servicing their guns are treated as open order infantry. In morale tests (including Pre-Melee Morale tests) they are treated as close order, as long as they have formed supports within 8." Artillerymen may fire their artillery pieces or small arms and melee in the same turn. However, if they fire their gun they must melee as disorganized. As mentioned, they must take time to form up to melee as close order, while formed in close order they may not fire their gun.

## 6. Screening

Artillery crews when working their guns are considered to be in open order and may screen a unit behind them. They must be no more than 1" apart to screen.

## 7. Abandoning the gun

Artillerymen may fire their gun and either run on foot  $\frac{1}{2}$  of the normal move distance (like light infantry) or limber the gun and move it  $\frac{1}{2}$  of a walk move. They may trot or otherwise move a full move if they do not fire their gun. Horse artillery may fire and move a full trot move. Artillerymen who do not pass a Pre-Melee Morale test before they had the opportunity to fire may not fire. If Artillerymen are forced back because of a melee (they can't be forced back as the result of a morale test), or otherwise must move, they abandon their guns.

## 8. Limbering/unlimbering

Limbering and unlimbering is considered automatic depending on the distance being moved. The time period required is less than  $\frac{1}{2}$  but more than  $\frac{1}{4}$  turn. To avoid confusion limbered guns can be shown facing backwards.

## 9. Reloading

Reloading is considered automatic whenever a gun is fired. In certain circumstances the umpire may rule that a gun has not had sufficient time to reload. For example, a gun that fired at the extreme end of the previous turn may not fire at the beginning of the next turn.

## 10. Distracting the crew

Rifle, musket, or cannon fire directed at an artillery crew (working its gun) reduces that crew's accuracy (represented by subtracting one from the dice roll). A minimum of two points firing at each gun is required. At least one cannon must fire at each gun.

## 11. Infantry or cavalry supports

Artillery that is more than 12" from its supports must shake for morale.

## 12. Infantry used as crewmen

Elite infantry (FF 7 or better) can act as additional artillery crewmen. No more than 1 point per gun (coupled with at least 1 point of artillerymen) is allowed.

## C. Firing Procedure

## 1. General

(a) Use **Chart #9** for fire against all non-structure targets. Use **Chart #10** for fire against structures. **Chart #7** has range information.

(b) Artillery is generally fired during the artillery fire phase. Pieces may fire at any time during a move; they may hold fire until the target is closer. If fire is held the actual dice rolling and calculating should still be done during the artillery phase when possible.

(c) No pre-measurement of range is allowed. If a gun is pre-measured it may not fire.

(d) Hits received from artillery fire are assumed to take effect before hits from small arms fire which may have occurred simultaneously during the turn. If the artillery fire is held into the second half of the turn, infantry fire during the first half will take effect first.

(e) Artillery pieces may fire through a gap in close order friendly troops if the gap is the width of the artillery stand. The artillery piece must be positioned no more than 2" behind the line. Howitzers must be positioned at least 4" behind a line in order to fire over it.

(f) Flat trajectory artillery may only fire over the heads of friendly troops when either the target or the gun is sufficiently elevated to allow a direct line from the gun to the target plus a cushion of at least 2" between this line and the heads of the friendly troops. Cannister may not be fired over the heads of friendly troops without ½ of the hits being taken on the friendly unit.

## 2. Improving accuracy and range

(a) Decrease range: Bringing an artillery piece in to close range (½ of effective range) will allow the player to use the CR (close range) column of **Chart #8**. If the combination of circumstances is such that the CR column cannot be used add one to the dice roll and use the regular CO column. If the range is shortened to "Point Blank" (½ of close range) then each gun fired gets an automatic hit plus whatever is calculated from the dice roll. If the target, however, is in Skirmish formation or a dense forest no automatic hit is awarded, instead add an additional 1 to the dice roll (so +1 for close range and +1 for point blank range).

(b) Repeated firing: For each turn (after an initial firing) in which the target and gun are unmoved (and the firing gun is not, or has not been, re-sited to another target) the artillery piece may add one to the dice roll. For example, on the third firing at the exact same target where neither the gun nor the target has moved, the player may add two to the dice roll when calculating hits. This rule does not apply when the target is in skirmish formation.

(c) Enfilade. An enfilading position is one that looks down a column or line the long way. Enfilade on a column is from the front, for a line it is from the side. In order to have enfilade fire the cannon ball must be able to pass through at least three companies (15 points in the case of a line). Units in skirmish formation or open order are not exposed to enfilade. Artillery has an additive factor on **Chart #9** when firing enfilade. Please note, use the enfilade adjustment when firing at a line, or non-attack column. When firing at attack columns (which also have various adjusting factors, depending on the depth of the column) artillerists add the adjustment for the attack column, not both. The enfilade adjustment does not occur for canister fire or explosive shells.

(d) Elevation: For each 1" of elevation of the gun above the target the range is increased 2" up to a 3" increase in elevation (6" increase in range). Canister is increased 1" for every 1" increase in elevation (up to 3" increase in range).

## 3. Anti-personnel

Use **Chart #9** for artillery fire against personnel. Keep in mind the various modifiers located on the bottom half of the page. When firing at troops inside a structure (or a superior position) the type of structure will determine if those troops gain additional protection from open order or skirmish formations. Troops in enclosed buildings may not gain additional protection from OO or SK. Troops in forests, or behind walls may obtain additional protection in a dispersed formation.

## 4. Counter battery

To knock out an opponent's artillery piece requires two steps. First, obtain a hit against the opponent's artillery crew (by firing at close order troops subtracting two from the dice roll because they are in "open order," see **Chart #9**). When a hit is obtained against the crew shake two more dice (without using any modifiers) and check the results on the counter-battery column. A DD means the gun is destroyed for this game and the duration of any campaign in progress; a D means the gun is out for this game only.

### 5. Structures

For artillery fire against structures use **Chart #10**, only two adjustments to the dice roll apply, target and gun unmoved and close range. This chart may be used for fire against personnel inside a structure as well as against the actual structure itself. When using this chart, hits against troops inside the structure also count towards weakening the structure and are, therefore, contributing to its destruction, see also section **X. House to House**.

## D. Morale Effect

### 1. Grand Battery

For all armies, when at least 15 guns are concentrated physically on a battlefield (all batteries need not necessarily be placed adjacent to each other, just near) and whose fire is concentrated into a target of roughly the same size as the grand battery, then all units who are the target must shake for morale at a minus two (see **Chart #2**).

### 2. Rockets

Troops under fire from a battery of rockets must shake for morale at a minus one.

## E. Incendiary Rules

### 1. General

Structures made of wood or thatch are subject to being set on fire when struck by shells, mines, rockets, "hot shot" or "carcasses" (packets of inflammable material fired by any kind of gun). The range of a carcasse is  $\frac{1}{2}$  normal effective range for a field piece. Each cannon may fire only three carcasses during the course of a game. Round shot is not considered incendiary unless heated, hence "hot shot." Allowance must be made for those furnaces to be on the table.

### 2. Procedure for firing a carcass

(a) Specify that a carcass is being fired.

(b) Obtain a hit against the structure, using **Chart #10**. If firing a rocket you must subtract two from the dice roll when calculating to obtain a hit. When firing at a forest or other extensive object a hit is automatic for cannon if within range. A rocket must shake a 3-6 on a six-sided die to obtain a hit.

(c) Throw two more dice to see if the structure catches fire. Use the modifiers at the bottom of **Chart #10** and follow the instructions there to determine if a fire starts.

### 3. Fires

(a) Troops occupying the area just ignited may fight the fire. Four unoccupied points automatically extinguish the fire during its first turn. Troops fighting fires may not be involved in any other activity.

(b) Fires may only be extinguished during the turn when it first ignites and the following turn. After these two turns the fire is considered out of control.

(c) When a fire is out of control all troops within 1" of the fire (2" for cavalry and artillery) must be evacuated that turn or they will be lost. In subsequent turns they may not come closer than that distance.

(d) When the fire is out of control a column of smoke is produced which is 2" wide and 8" long. This increases to the width of the structure and 16" long over four turns. This smoke can obscure visibility.

(e) Forest fires spread, when out of control, at a rate of 2" per turn downwind, if there is a wind, or in all directions if there is no wind. They will not spread to another not contiguous forest.

## VI. Morale

### A. Importance

During the Napoleonic period morale was as important a factor as possibly any other in determining victor and vanquished. In fact, Napoleon said, "...in war, the moral is to the physical as three is to one."

In these rules morale is determined at critical times for each unit by a dice roll. As will be explained below two dice are shaken and the results are adjusted for factors such as experience and training, presence in a protected position, and the presence of mounted officers. The result will determine if a unit stands its ground, performs as ordered, retreats, or runs.

### B. Panic level

1. Panic level occurs when a unit's combat effectiveness is reduced 50%, meaning it has lost 50% of its beginning-of-the-game points. Panic level means that the unit is on the edge of running, and in these rules is designed to create enough morale stress such that only the experienced and veteran troops will continue to fight after reaching panic. Generally determining when a unit reaches panic is simple and straightforward (it has lost 50% of its beginning-of-game points). However, there are 2 circumstances that may require special attention:

- (a) If a unit is subdivided on the battlefield (defined under item (c), below) it must calculate the 50% loss for its separate parts independently. For example, if a 32 point battalion is divided into two pieces with 17 points in one location and 15 points in another (the Command Stand is with the former group) then the 17-point group will arrive at panic when it loses 9 or more points. The 15-point group will arrive at panic after it loses 8 or more points. One part of the battalion can be in panic and the other just fine, until such time as the subdivided parts reunite, then panic will be calculated for the entire battalion as normal.

One exception to this rule exists in the case of an individual company (preferably and generally a light company), or single squadron of light cavalry, acting independently of the parent battalion or cavalry regiment. One company, acting independently and removed from the parent battalion never has to determine if it is in panic. A group of individual companies from separate battalions, however, when acting together such as in a converged grenadier battalion, must determine panic collectively, as a unit, and act according to the consequences.

- (b) A multi-battalion regiment, with more than one battalion acting together (defined under item (c), below), can take advantage of a special method of determining panic. Please note, this method requires some additional work on the part of the player and is **therefore elective**. However, if a player elects to use this method for a game he or she must use it for the entire game, for all units that qualify.

This method allows a player to determine panic at the regimental level - the entire regiment reaches panic when losses among the battalions reach 50% of the regimental strength - when more than two or more battalions of a multi-battalion regiment are acting together. If, however, an individual battalion loses 60% of its initial strength it will be in panic, irrespective of the losses for the entire regiment. Here is an example. Two battalions of the same regiment, each of 26 points, are acting in concert. The first battalion loses 13 points and the second loses 8 points. Normally the first battalion would be in panic, but under the regimental rule the combined losses are 21 points, short of the 26 (50% of 52 combined points) necessary to panic the entire regiment. In a following turn the first battalion loses a further 3 points, for a total of 16 points lost. It has now lost 60% of its 26

points and is panicked. The entire regiment has only lost 24 points (still short of 26), yet the first battalion must dice for morale and, depending on the results, may choose to quit the battlefield.

- (c) Items (a) and (b) require that a player determine if units are acting independently (as in item (a)) or together (as in (b)). Geographic proximity is the determining factor. For units to be acting in concert, as in (b), the battalions must be adjacent and within 8." Conversely for the subdivided pieces of a unit to be independent they must not be adjacent and must be more than 8" apart. A separate unit could pass between two units and not affect adjacentness, unless that unit lingers.

2. When a unit reaches panic level it must immediately shake for morale, adjusting the dice role (-4) for the penalty of being in panic. Once a unit reaches panic level it must dice for morale (with the same negative adjustment to the dice roll) every remaining turn of the game in which it is exposed to fire [or only if it wants to fire or initiate action?]. See the next section for a complete description of how to shake for morale, whether because of panic status or for other reasons.

3. A panicked unit need not test its morale if it takes position in the rear and is not required to perform any function.

4. When a unit with panic status undergoes any kind of morale test it must continue to subtract four from the dice roll (even when posted to the rear).

5. In some large games the players may decide to remove units that reach panic. This is an effective means of speeding the flow of a game, and is an acceptable alternative to the foregoing.

### C. Procedure

#### 1. When to shake for morale (see also **Chart #2**)

(a) When a unit reaches panic level it must shake for morale immediately. This can occur at any point during a turn. If a battle is particularly sanguine it is advisable at the end of each turn to perform a quick inventory of units that are taking considerable casualties in order to stay abreast of newly panicked units. It is acceptable for an opposing player to request that a player check a certain unit or units to see if they have incurred casualties sufficient for panic status. He or she has no right to know the unit's actual strength, of course.

(b) Whenever a mounted officer is lost all units under his command must shake for morale subtracting 2, 3, or 4 depending on the level of the officer. Only adjacent units must shake that same turn. All other units under that officer shake the following turn.

(1) When a colonel (or other battalion-level officer) is slain all battalions under his command must shake with a minus two. When a General of Division is lost all units in his division must shake with a minus three, for example.

(2) When shaking for morale due to the loss of an officer the test is obviously performed without the benefit of the lost officer, i.e. no replacement has been named. In subsequent turns, for all but the supreme commanders on the field, a replacement is assumed to have succeeded to the position of the lost officer.

(3) Mounted officers without commands (ADCs primarily) can be lost without negative consequences to the troops with which they are located. Conversely, an ADC does not add or strengthen troops when they must undergo a morale check.

(4) Imperial ADCs to Napoleon (Mouton, Rapp, Savary, etc.) are an exception. They may add to morale of units around them, and their loss will affect any units they are commanding, or if not commanding, any adjacent units.

(c) Whenever a unit's flag is taken that unit must shake for morale with a minus two. As will be mentioned below (section **VII. Melee**) a flag can be taken only during a melee and only by shaking a six. A command stand may be destroyed only if it is the only part of a unit left or it is the only part of a unit exposed. The loss of a command stand does not guarantee the capture of a flag.

(d) All units adjacent to (and within 18" of ) a retreating or routing unit must shake for morale. This rule (called contagion) checks for the contagious effects of bad morale and panic.

(e) Whenever a unit is caught in a crossfire from formed bodies of troops (units cross-firing must number at least 40%, each, of the unit(s) under fire, may include troops in open order) or artillery it must shake for morale. In order to qualify as a crossfire the fire must come from sources whose bearing to the target is practically 90 degrees (or greater) apart.

(f) Every time a unit is defeated, broken, or otherwise incurs bad morale (including refusing to advance or falling back) it must shake for morale in order to clear its morale "slate." Until this is accomplished it may not perform any proactive function. Units that refuse to advance may at least reform or change formation, as necessary.

(1) Until a clean slate is obtained the unit will continue to do whatever it is doing. For example, a routing unit will continue to rout until its morale situation is improved. A unit that refused to advance will not advance (may retreat) until it can pass a morale check.

(2) Clearing up bad morale may occur in degrees (see item 4 below). A routing unit may slow its rout to a retreat, and eventually end up halted at which time it may reform.

(3) When clearing up bad morale it is important to note that a unit retreating subtracts two from the dice roll and a routing unit must subtract three from the dice roll in every turn it routs and in the first turn after it halts from a rout. Routs can be dangerous.

(g) When a unit is under fire from a grand battery (15 or more guns) or a rocket battery it must shake for morale subtracting a 1 (for rockets) or 2 (for a grand battery) from the dice roll.

## 2. How to test Morale (see also **Chart #2**)

(a) **Chart #2** is the chart used to test morale. When a unit must shake for morale two dice are shaken. Additions and subtractions from the dice roll are made according to the adjustors on the chart. Go quickly through the adjustments and add or subtract the amounts to the dice roll that apply to the situation of the unit in question. A description of the adjustments follows (these are additive):

Increases to dice roll.

(1) Mounted Officers. A unit can add for mounted officers that are within the distances specified on Chart #2.

(i) The amount of the adjustment (+4 for the highest ranking officers to +1 for the regimental and battalion officers) depends on the rank of the officer.

- (ii) Only two officers can be counted in a morale test and one must be the unit's own battalion or regimental officer. If lost he may not be counted in that turn. In subsequent turns these rules assume a replacement is located.
  - (iii) Officers can only be used if they aren't otherwise occupied. In other words, if two units have morale tests at the same time, the player must decide with which units to use general officers, and sometimes regimental officers.
- (2) Superior Position. If a unit is in a superior position it can adjust its dice roll for that morale advantage. The amount to add is dependent on the type of position (see **Chart #2**). If the superior position is compromised (breached, for example) it is possible that no addition is made to the dice roll.
  - (3) An infantry unit that has formed square can add four.
  - (4) If a unit has won a melee or a Pre-Melee Morale (see item D., below) in the current or preceding two turns it can add two to the dice roll.
  - (5) If a unit has a second line in support it can add one to the dice roll. A second line in support is a unit within 12" (can be a part of the same unit) that:
    - (i) is behind the lead unit or is behind and to the side but overlaps with at least 50% of its strength (some leeway allowed for columns).
    - (ii) is facing the same direction as the lead unit. In certain circumstances, however, the 2<sup>nd</sup> line can have its back to the "lead" unit.
    - (iii) is at least 40% of the strength of the front line unit (30% for cavalry).
    - (iv) is not contiguous with, or touching, the lead unit.
    - (v) has essentially the same orders as the lead unit, for example the second line in support of an attacking unit must also be attacking, that of a defending unit could be moving toward the lead unit but can't be attacking or focused some other direction.
  - (6) A unit is fresh if it has not been involved in a melee or has not been exposed more than two turns to artillery fire (excluding long range) or small-arms fire. A unit is not fresh, however, if it has lost 20% or more of its points.

Decreases to the dice roll.

- (7) A unit must subtract one from the dice roll if it is disorganized.
- (8) A unit must subtract one from the dice roll if it is adjacent to a retreating unit.
- (9) When a separate and detached opposing unit is threatening a flank attack a unit testing for morale must subtract two.
- (10) A unit must subtract one from the dice roll if it is under fire from rockets.
- (11) A unit must subtract two if it is not in close order, whether open or skirmish order. The unit can be in open order and be disorganized.
- (12) If a unit is retreating, it must subtract two from the dice roll.
- (13) If a unit is adjacent to a routing unit, within 18", it must subtract two.

- (14) If a unit has lost its mounted officer (+1 or +2-type officer) or flag it must subtract two from the dice roll. It need only subtract this amount on the occasion when the unit's morale is tested because of the loss. If a higher-ranking officer is lost the negative adjustment increases, -3 for a +3 and -4 for a +4.
- (15) A unit must subtract two when it is under fire from a grand battery or when it is in a crossfire from either formed infantry or artillery.
- (16) When a separate and detached opposing unit is threatening a rear attack a unit testing for morale must subtract two.
- (17) If a unit is routing or routed the preceding turn it must subtract three from the dice roll.
- (18) If a unit is at panic level it must subtract four from the dice roll, see also the Panic section above.

(b) An example. An infantry unit of FF 4 has reached panic level and must shake for morale. The following adjustments apply; 8" from brigade general (+2), 8" from Col. (+1), is behind a hedge (+1), has a second line in support (+1), unit is in open order (-2), and Combat effectiveness is at panic level (-4). The total adjustment to the die roll is -1. The dice roll results in a 7, subtracting one is 6. Looking at the bottom of the chart we see that FF 4 troops who shake a 6 are forced back. They must backup 2", which disorders the unit, and may not perform any proactive actions until they have a clean morale slate. Before this unit can advance or attack it must clear its slate (see item 4 below).

### 3. Results

- (a) Refuse to advance means that the unit will stand its ground, defend itself, reform or change formation if ordered, retreat in good order if so ordered, or fire if so ordered. It is not disordered unless it was before the morale test. This is the least onerous failure to pass a morale test. A unit with this morale status may not advance, charge, or make any sort of forward movement. This morale status does not affect future morale or Pre-Melee Morale tests.
- (b) Forced back means that the unit was frightened enough to move back 2" for infantry or 4" for cavalry. For both infantry and cavalry a forced back disorders the unit. The unit may continue to defend itself as with the refuse to advance but may not make any forward movement until it has passed another morale test. This morale status does affect future morale or Pre-Melee Morale tests in that the unit is disordered (or disorganized) and must minus 2 from the die roll. The unit may not reform. In a following turn the unit may form up (into close order) as long as it achieves at least a refuse to advance or better in a subsequent morale test. However, if the unit is forced back again, retreats, or routs it will remain disordered because it never had time or the inclination to form up. Artillery units are not forced back.
- (c) A retreating unit must turn its back to the enemy and move a regular move to the rear (see **Chart #3** for the distances to move). This puts it at a significant disadvantage if attacked. It may fire only  $\frac{1}{2}$  of whatever portion of its number that ordinarily could fire. A retreating unit is disordered, as with the forced back. As long as the unit has retreat morale status it must continue to the rear and may not form up. As long as the unit is retreating it must subtract two from the dice roll in any morale tests.
- (d) A routing unit loses all formation (treated as disordered open order for all purposes) and flees by the easiest possible route to the rear. The distance a routing unit moves each turn is shown on **Chart #3**. A unit will continue to rout to the rear until halted. If it routs off the table during a game it is considered to be lost to that side and may not re-enter. In a campaign that unit will still exist, it is only lost for the one

game. For each turn in which a unit routs, and in the first turn after it is halted, it must subtract three from the dice roll.

#### 4. Rallying (clearing up bad morale)

Any unit that does not pass a morale test (receives a refuse to advance or worse) is tainted until that unit does pass a morale test. Clearing up bad morale can be done in stages. A routing unit may slow its rout to a retreat, then to a forced back, then to a refuse to advance, and then finally completely pass a test. Conversely, a unit may start with a retreat and end up with a rout. Each turn it will suffer the consequences of the morale status it has during that turn. In other words, it will continue to rout or retreat each turn until it has improved its morale status. A unit may only shake once, voluntarily, per turn to clean up its morale. Of course, if attacked or if for some other reason it needs to shake again for morale, it must do so and could possibly improve its morale status.

### D. Pre-Melee Morale

#### 1. Introduction

(a) Pre-Melee Morale is designed to test units that are closing to contact. It is generally accepted that in Napoleonic warfare the melee was a fairly rare event. Usually, it was fear of edged weapons that caused troops to give ground rather than the actual employment of those weapons.

(b) The Pre-Melee Morale test is actually a variation on the game of chicken. When units face off in what appears will be a melee those two units must first compete between themselves to see which one, if either, will chicken out first.

#### 2. Procedure

(a) The Pre-Melee Morale test is performed at any time during a turn when a cavalry unit is 16" away from its target, **and** it has the order to charge or is threatening to charge, or an infantry unit is 8" away from its target and has the order to charge.

(b) Only the target unit(s) and the charging unit(s) participate. If several units can be done together it is best to combine the operation and thereby minimize the amount of work to be done.

(1) When combining several units be aware that one side could have its additive factors "stacked" or unfairly built up. Two options are available to limit this possibility. First, split the units apart and do them separately. Second, limit the additive factors to a rough proportion of the total force.

(2) For example, a cavalry regiment is charging two infantry battalions. One infantry battalion is in a superior position the other is not. When calculating the Pre-Melee Morale it is easy to weight the infantry side as if both battalions were in the superior position. This would be "stacking" that side. In this case reduce the additive factor by half or calculate the test for the two infantry regiments separately. Umpires are chiefly responsible to make sure no side is unfairly disadvantaged.

(c) Generally, a unit behind another unit is not tested in Pre-Melee Morale. Keep in mind the following, however:

(1) If a unit in front is screening another unit (within 4"), the screening unit cannot be separately tested for the Pre-Melee Morale.

(2) If the unit behind can somehow be hit, either because the attacker can somehow reach it, or its flank is somehow exposed it can be tested.

(3) If the front unit does not pass the Pre-Melee Morale test, or retreats after a melee the victor may be able to test the second line unit immediately or in a bonus move.

(d) Multiple Pre-Melee Morale tests between the same units

(1) Generally, an attacker who wins a Pre-Melee Morale test but does not close with the defender (possibly because the defender was only forced back) may not force another test on that same unit under those same circumstances.

(2) If the defender won the first test the attacker may not re-test that same unit except under the circumstances (or changed circumstances) mentioned in item (3) below.

(3) If, however, the circumstances of either the attacker or defender change significantly the attacker may re-test the defending unit. The significant change must be something obvious to the defender, which would cause them to doubt their chances in a melee. Generally, a change of formation on the part of either party (for example, formed close order for the second attempt or defender is now open order and previously was close order) or a change in the status of a second line in support are about the only acceptable changes of circumstance.

(e) Pre-Melee Morale tests may only be performed on true skirmishers if the defender (the skirmishers) wants to maintain his ground. True skirmishers are considered to flee (without morale consequences) when threatened. If their opponent is cavalry, and they can reach the skirmishers, the skirmishers will be overrun without the need to calculate a melee.

(f) Calculating the Pre-Melee Morale

(1) Use **Chart #3**. For both sides, add and subtract the adjusting factors in the center of the page. You will end up with a total for each side. Generally these adjusting factors follow fairly closely those used for the standard morale calculation (see section 2, above). The additive amount of a factor may be different and some particulars of language may be slightly different. Be aware of these changes. For example, in the Morale calculation (**Chart #2**) the item for retreat reads, "Unit is retreating." In the Pre-Melee Morale chart (**Chart #3**) the corresponding line item reads, "Unit is retreating or retreated preceding turn." Other adjusting factors that are not described in section 2 are described here as follows:

- (a) Cavalry or infantry charging applies when a unit has a positive order to charge and is carrying out that order. For cavalry this can be either a trot or gallop charge. The unit must have covered (or be able to cover) 6" of ground before contact.
- (b) Unit charges with cold steel applies when the unit is unloaded at the commencement of the turn in which they charge. That unit may not have fired in this turn. They will not be able to fire until ½ turn after the charge and any resultant melee have concluded.
- (c) Outnumbers enemy 3 to 1 is straightforward. The numbers exclude units charging or acting in support.
- (d) To receive the increment for delivering a flank or rear attack, the attacker must be capable (en route is acceptable) of striking the flank or rear of the defending unit. Wrapping around from a frontal attack does not qualify.

- (e) Units charging under the eye of high-ranking officers (20" from +5 or 12" from +4) receive this additional advantage. In a Pre-Melee Morale test only two officers can be used. An officer used in this way doesn't count as one of the two.
- (f) Cavalry threatening to charge is given to a cavalry unit that can charge (may have a charge-if-opportunity order), has adequate morale, and where no other factors inhibit such a charge.
- (g) Heavy cavalry and lancers get an additional additive factor. For lancers this only applies when they are facing infantry.
- (h) The adjustment for the difference in fighting factors (FF) is calculated by taking the FF of the lower-rated unit and subtracting it from the FF of the higher-rated unit. The result is then reduced by one to obtain the final adjustment (added, if applicable, to the other factors of the higher-rated unit). For example, a FF 7 cavalry unit is charging a FF 5 infantry unit. The difference between the FFs is two, which, when further reduced by one is one. The cavalry unit will add one more to its total.
- (i) Some additional description is necessary with respect to units disorganized or not in close order:
  - (i) First, artillery units that are within 8" of supporting troops need not deduct for being in open order.
  - (ii) Second, if a charging unit would be forced into disorder or open order (or both), for any reason, prior to contact with the opposing unit it must deduct for such disorder or open order in the Pre-Melee Morale even though that is not the case at the moment of the test. Charging a unit in a forest, or across a stream, are good examples.
- (j) Flanks in the air. Except in the case where cavalry is charging, if a unit does not have some support within 8" of both flanks (or have those flanks refused) it will have to subtract 2 from its total.

(2) Once a total of the adjustment factors is reached each side shakes two dice. There is no adjustment to this dice roll. The results are compared with the table at the bottom of **Chart #3**. That table shows that high dice rolls (11-12) add two to the total. Moderately high dice rolls (9-10) add one to the total. Rolls of 6-8 receive no change. Rolls of 4-5 subtract one and rolls of 2-3 subtract two from the total.

(3) The adjusted totals of the two sides are now compared. Subtract the lower total from the higher total. Take the result and compare it to the table on the bottom of **Chart #3**. This is the difference, which if great enough, can cause the loser to halt (if charging, a defender is forced back), retreat, or possibly route based on the margin of victory.

#### (f) Results

(1) The entire losing unit must act according to the results (unless part of the unit is separated geographically by at least 18" or psychologically by being in different terrain or otherwise focused elsewhere). Movement is based on the distances displayed on the bottom of **Chart #3**. The consequences of forced back, retreat, and rout results are the same as under the regular morale rules (see **C.3** above).

(2) The winner, if charging, must complete his move unless he can halt the charge. A winning unit, that is either threatening to charge or was defending, can act on new orders (such as a charge if opportunity not previously used – as a reactionary move). Winning a Pre-Melee Morale test does not endow the winner with a bonus move. He simply has the option of completing his charge and possibly hitting a disadvantaged opponent.

(g) General Exceptions

(1) When a unit surprise attacks another unit no Pre-Melee Morale test is required. This is because the target unit is not considered to have had sufficient time to react to the attack. A surprise attack is determined when:

(i) the two sides are quite close to each other at the beginning of the attack (basically 4” and 10”), or

(ii) the target player is surprised. If he's surprised his troops were probably surprised too.

(2) Similar to item 1 above, when two units are quite close together there is no time for the soldiers of either side to consider the relative merits of closing with the bayonet. They just do it. Distances here are also closer than those at which a Pre-Melee Morale test would normally occur. Generally if the troops are within 4”-5” for infantry and 8”-10” for cavalry no test need be done.

## VII. Melee

### A. Introduction

1. When both sides close to contact, after passing the Pre-Melee Morale test, then a melee occurs. A melee is hand-to-hand combat. All troops involved in a melee must be touching or within ¼". The points involved may only be two ranks (not stands) deep for each side.
2. Troops engaged in a melee may not fire during the melee and troops outside the melee may not fire into it without hitting friend and foe alike. If it can be shown to the umpire that the opponent is very exposed, firing may be allowed at the umpire's discretion.
3. Troops that held their fire before a melee may fire immediately after it. However, if they do not take time to form up they will do so disordered. Troops may not otherwise fire during the half move immediately after a melee as they are reloading. Troops may not reload while reforming, or otherwise changing formation.

### B. Procedure

1. Number of points involved
  - (a) Add up all points involved in the melee. All points which are touching (or within ¼") may be involved (no need to scrape the figures together). Only the first two ranks are counted. Points in a third rank, or skirmisher points acting as a third rank, are excluded from the melee calculation.
  - (b) A unit that overlaps its opponent may wrap around the opponent's flanks. This is not treated as a flank attack it only increases the number of points that are involved for that side. Wrapping is subject to the following conditions:
    - (1) Some units may not wrap because it is too difficult for them to get at the opponent.
    - (2) Cavalry units can always wrap subject to item 1, above.
    - (3) Infantry units defending in a line against infantry or cavalry may only wrap one company (up to a maximum of 2 points) around each flank of the opponent. The wrapping points must be contiguous and of the same unit. The entire line may not collapse around the opponent as this would require a movement order. An adjacent infantry unit may not wrap around a cavalry unit and may only wrap around an infantry unit if it has the proper orders.
2. Adjustments
  - (a) After the points involved are totaled, this number is modified by a number of factors that weight the sides based on quality, formation, shock, or position. The modifiers adjust the total by adding a certain percentage (multiplying by 1.2 for a 20% increase) to the total points.
  - (b) See **Chart #4** for the modifiers. A description of some special additive factors follows:
    - (1) Charging downhill: Cavalry attacking downhill (the hill must be a dominating hill that qualifies as superior position #1) receive this increment. Hills of this size do not necessarily constitute rough terrain. If the hill is rough terrain, as determined by the umpire (see section **VIII. Terrain** below), then the hill will disorder the charging cavalry. There must be an appreciable amount of slope in order for the cavalry to gain this increment.

(2) Opposing cavalry charged less than 6": Cavalry must charge 6" in order to get their full shock advantage. When they have charged less than 6" they are penalized. As noted in item (c) below, these melee rules penalize one side by rewarding the other side.

(3) Opponent disorganized or opposing cavalry standing still: means the opponent is disordered or disorganized because he has passed through rough terrain, fought a melee without forming up, or for some other reason. Cavalry standing still could be penalized for being disorganized as well as standing still.

(4) Opponent in OO or SK: OO means open order, SK means skirmish formation. Close or open order cavalry will automatically overrun infantry skirmishers (losing 1 point for every 10 lost to the skirmishers). Otherwise the melee must be fought out.

(5) Attacking flank: This must be a flank attack by a separate unit. Wrapping around the flank does not constitute a flank attack, as mentioned above.

(6) Attacking rear: As with the flank attack this must be by a separate unit. If there is any question whether a flank or rear attack occurs and the evidence is balanced a flank attack should be used.

(7) Superior positions: These factors are for infantry (or dismounted cavalry) that occupy a superior position.

(c) These rules approach circumstances that are disadvantageous to one side by strengthening the opponent. For example, in a cavalry melee where one side is in open order that side is not punished, rather the formed opponent receives additional increment when calculating the melee. This approach should be used whenever possible.

### 3. Determining results

(a) After the additive factors have been identified a final percentage is then applied to the total number of points. **Chart #6** is used to calculate the adjusted point totals. For example, two cavalry regiments engage in a melee. Both regiments have 20 points. One of the regiments is light cavalry, but with lances, the other is medium cavalry. Both are fighting factor 6. The net adjustment to the lancers is +90 (+20 for lances, and +70 for FF 6 light cavalry). The net adjustment for the dragoons is +90 (+90 for FF 6 medium cavalry). Turn to **Chart #6** and calculate that both units increase to 38 points.

(b) Each side shakes two dice. Each player may add one to the dice roll for the presence of a mounted officer leading the charge and placed at risk (only officers which can affect morale count, generally no ADCs). At the bottom of **Chart #4** is a small table used to calculate the adjustment percentages from the dice roll. These percentages are applied to the adjusted points (not the actual/initial number of points). Continuing with our example if the lancers shake a 5 (+1 for an officer so 6) the result is no change. They remain with 38 points. If the dragoons shake an 8 (+1 to 9, for an officer) then they receive an additional 20% increment, increasing their adjusted point total to 46.

### 4. Results

(a) The final point totals are compared on **Chart #5** to determine what happens to the opposing units. Since 46 is off the chart both totals will need to be halved. Compare the column under 23 with the row for 19. The intersection occurs within the unshaded area that designates the loser is forced back

(b) At the top of **Chart #5** is a table that explains what happens for each possible result of a melee. From this we see that the loser (the lancers), in our example, loses 40% casualties. This 40% is of the original number of points involved (not the adjusted point totals), in our example 20. The lancers will lose 8

points (see also **Chart #6**). The winner (the dragoons) loses 60% of what the loser loses, or 5 points. The lancers must draw back 4". Both units are now disordered due to the melee. The Dragoons have the option of a bonus move (see item **C.** below). The dragoons can either continue the melee, retreat, or reform. The latter option will strengthen their hand in any immediate engagements.

(c) In a tie there is no loser. Both sides lose 40% of the base number of points, and the two units remain in contact. Both sides are disordered by the melee.

(d) If the result of a melee is a retreat then the loser must turn his troops around and move them to the rear. The requisite distances are on **Chart #5**. He loses 50% of his base number of points; the winner loses 50% of that number. If the retreating unit was in close order before the melee it is considered disordered-close order during the retreat. If it was in open order before the melee it will be disordered-open order during the retreat. In succeeding turns if the loser needs to fire his troops he may only fire  $\frac{1}{2}$  of those that could fire. To understand the morale consequences of a retreat see section **VI. Morale**. The winner, of course, has the option to bonus move.

(e) A routing unit loses 60% of its base number of points and moves the requisite distance to the rear. It must choose the path of least resistance. It is considered disordered-open order regardless of its formation before the melee. Until the rout is halted the loser may not fire. The victor loses 30% of what the loser loses. A routing unit will continue to rout to the rear until it clears up its bad morale (see section **VI. Morale**).

(f) In cases where only part of a unit is engaged in a melee, generally the entire unit must perform according to the results of the melee. However, if the part of the unit not engaged is definitely separate and otherwise unaffected by the melee it need not suffer the results of the melee.

## 5. Miscellanea

(a) Infantry skirmishers attacked by cavalry are automatically ridden down (eliminated). If this happens the cavalry lose one point for every 10 lost by the skirmishers. If attacked by infantry the melee must be calculated.

(b) A unit that can reach a melee during the same half turn in which the melee occurs are included in that melee as if they were there from the beginning. If they arrive during a different half turn they may not participate and must wait to engage a possible victor. Implicit in this rule is the assumption that a melee basically takes one half of a turn. This is not always the case but it is a reasonable place to draw the line.

(c) Following a melee the players involved have the option to shake a die to see if any mounted officers were casualties or any flags were lost during the melee. For each officer involved a die is thrown. A six on the die means that officer was KIA. For flags, also, a six means the flag was taken. The original owner has the option to see if the flag is retaken during the melee. A six by that side means it was retaken and, at least for that melee, cannot be retaken again by the opponent.

## C. Bonus Move

- Following a melee the winner (a tie is not a win) may make a bonus move. A bonus, or breakthrough, move allows the winner to choose a target of opportunity anywhere within his movement allowance. The rationale behind this rule is to give the victor of a melee an advantage, which, it is hoped, will contribute to breaking the typical wargame of attrition.
- The unit making its bonus move will do so at the quick step for infantry or trot for cavalry.

3. Only one bonus move may be done per unit per turn. If a melee occurs during a bonus move, the unit that made the bonus move, if victorious, may not make another bonus move. If the opposing troops are victorious they may make a bonus move provided they have not already done so.
4. All units making a bonus move are disordered during that move. This is because they were disordered by the melee in which they were victorious. As will be discussed further in item 6, below, supporting units that also get to participate in a bonus move aren't disordered if they weren't engaged in the melee.
5. The victorious unit may elect to use its bonus move to reform (or reload for infantry but not both). This will consume the bonus move, but also prepares the unit for the following turn.
6. Any two units moving up in support of a victorious unit, which is granted a bonus move, may also bonus move. Those units must have been included in any Pre-Melee Morale as a second line in support, or otherwise have qualified as such by meeting the requirements listed in section **VI. Morale**. If there is a question the umpire will lean toward excluding the supporting units in question.
7. Bonus moves are still subject to the Pre-Melee-Morale (see section **VI. Morale**). However, the exceptions noted in that discussion, for surprise attacks or distances too small, should be more loosely interpreted.
8. Opposing forces may fire at a bonus moving unit if: 1) they have not already fired, and 2) they have an order to do so (may be "fire if opportunity"). However, if another unit has fired across that same ground earlier in that turn they may not fire.
9. During a bonus move, no other forces are allowed to move or form up. The limited exception is where the melee clearly occurred during the first half of a turn and the bonus move would seem to occur during the second half. In this case, surrounding units may be allowed to complete their moves or complete forming up.
10. The bonus move that occurs after the second half of a turn is considered to occur in a space-time vacuum between one turn and the next. Units who have orders to change formation during the turn in question, and would not complete that change until the end of the turn, will not have completed their change of formation before the bonus move.

## VIII. Terrain

### A. Introduction

In these rules the terrain displayed on the playing area is generally to be taken at face value. The rules are designed to accommodate most of the terrain typically encountered. This section will discuss treatment under these rules of the various terrain features, as well as a discussion of some of the issues that arise in conjunction with each kind of terrain.

### B. Superior Positions

#### 1. Overview

(a) Superior positions offer protection, increased firepower, and increased morale to the troops in possession thereof. Superior positions are divided into three groups depending on the degree to which they offer advantages.

(b) Superior positions may not be compounded or added together. For example, troops on a hill and in a forest may not add their two superior positions #1 together to get a superior position #2 or to otherwise double the benefits of a superior position #1. The only way to obtain a higher superior position is to possess that kind of terrain.

#### 2. Superior Positions #1

(a) Hills. In order for hills to be considered a superior position the hill must be a significant feature in relation to the surrounding terrain. Hills up to 2" high are not dominating enough to offer a superior position. Hills that are 4" above surrounding terrain clearly offer the possessor a superior position in relation to his opponent. Umpires will need to make rulings on this subject, but as guidance, low hills are not to be considered superior positions. A hill that has been identified as a superior position is not necessarily rough terrain. The biggest factor in determining if a hill is rough terrain is its steepness.

(b) Dense forests. Dense forests will be discussed in greater depth under section **D.** below.

(c) Hedges. Any hedge at least ½" high and which is more or less unbroken is a superior position #1. Cavalry may jump a hedge if the hedge is short enough (up to 1" for light cavalry, ½" for heavy or medium cavalry). Infantry may negotiate a hedge (or a wall or fence). It takes one full turn for a line to cross over, after which it is disordered. A column of infantry may entirely cross through a hedge (or wall/fence) in two turns, after which it is disordered.

(d) Rubble. A house that has collapsed is a superior position #1 to any troops that occupy it. See section **X. House to House Fighting** for more information.

(e) Hasty earthworks. These are earthworks with relatively shallow trenches with unreinforced or hastily piled earth. They are the only earthworks that can be prepared during a table battle. See section **XI. Construction.**

(f) Abattis. Abattis is piled boxes, barrels, trees, brush, sacks of meal, overturned wagons, in short whatever material on which troops can lay their hands.

### 3. Superior Positions #2

(a) Houses. Houses offer protection as well as increased firepower.

(1) Houses may only hold a certain number of men. The number of points allowed in a given house is specified on the bottom of the house. The information on the bottom also gives the number of points that can fire out the various sides of the house.

(2) During the first turn in a house only  $\frac{1}{2}$  of the troops (who otherwise could fire) may fire because they are considered to be loop holing the walls as well as moving to position.

(3) Troops in houses are always considered to be in close order because of the necessity of crowding around windows and doors in order to fire.

(4) For houses with two floors,  $\frac{2}{3}$  of the troops allowed in that building are considered to be on the bottom floor. For houses with more floors the ground floor is considered to hold twice as many men as any other floor. This issue is important because of melees that may occur with men in a house. Of course, if the player has stationed fewer men than the house can hold, he can specify which floor(s) they occupy. For more information on houses see section **X. House to House Fighting**.

(b) Rock walls. Unlike houses, troops along rock walls may form in close order, open order, or skirmish order.

(c) Improved earthworks. Improved earthworks are hasty earthworks that received more time and thought. Improved earthworks may not be constructed during a table battle. For more information on earthworks see section **XI. Construction**.

### 4. Superior Positions #3

(a) Forts. Fortifications like Danzig, Spandau, or Fort McHenry are considered superior position #3. These take considerable time and resources to construct and obviously cannot be done on the battlefield.

(b) Prepared earthworks. Earthworks that are reinforced with wood or stone, and/or trenched, and/or covered are considered prepared earthworks. As with fortifications they may not be constructed by troops during a battle. See section **XII. Campaign** for more information on preparing superior positions #3.

## C. Cover

### 1. Description

Certain terrain features do not qualify as superior positions because they don't provide enough advantages to warrant that kind of designation. However, these kinds of terrain do obscure troops occupying them and, therefore, help protect those troops from hostile fire. These terrain features are designated as cover and given special consideration in the rules. Troops in cover, if hidden, need not be represented with markers. Once troops in cover have been spotted they must remain visible (i.e. the troops must be set out or, if screened, represented by a marker).

### 2. Types

(a) Light forests. These will be discussed in greater depth under **D.** below.

(b) Fields with crops. Fields that have tall grasses (corn, wheat, rye) obscure visibility and therefore make identification and firing more difficult. Visibility inside a field is as for a light forest.

## D. Forests

### 1. Dense forests

(a) Forests come in two varieties, dense and light. Dense forests have thick tree growth as well as considerable undergrowth. Dense forests are represented on the playing area with dark green felt. Dense forests, as mentioned, are classified as a superior position #1. Dense forests severely limit movement, see also **Chart #1**.

### (b) Visibility

(1) Visibility into dense forests is limited to 1" from the edge, for those outside looking in. Troops inside a dense forest must be within 2" of the edge in order to see or shoot out, and visibility inside the forest is otherwise limited to 4." Troops not within these bounds are invisible (no troops or markers need be displayed (see section **IX. Hidden Movement**)) until spotted. Two exceptions to that rule exist:

i) If the troops inside the forest cover more than 25% of the area of the forest. In that case either markers or the troops themselves must be displayed.

ii) By shaking one die scouts (or formed units or ADCs) on the outside have a chance to learn something about troops, if any, which lie within 4" of the boundary of the forest. The scout can only "test" the area within 12" of his person. The player shakes one die. If the result is 1 to 4 he learns nothing about the forest. If he shakes a 5 or 6 he sees or hears enough to know that there are troops inside the forest (w/in 4" of the edge). If troops are inside the forest a marker must be placed where they are located. This test may be performed once per scout (or ADC) per turn. Using this approach a scout can uncover an ambush.

(2) When troops have been spotted they must be placed on the table (unless the spotting player says a marker is acceptable or the unit is screened). When the spotter is removed beyond the visibility distance the troops may revert to invisibility.

(c) Firing inside a dense forest is limited to the 4" visible horizon. Even though small arms ranges exceed 4" it does not matter in a dense forest. Since close range for small arms is greater than 4" all firing done inside a dense forest is done at close range.

(d) Troops firing from a dense forest do so as normal (except that they are in open order - and possibly disordered) as long as they are within 2" of the border of the forest. If not within 2" they cannot fire nor can they be fired at. See also the Ambush rule under item (f), below.

(e) Dense forests are a superior position #1. As such they offer protection and an advantage to those who control them.

### (f) Formations

(1) All units in a dense forest (whether stationary or moving) must be in open or skirmish order. If an open order unit moves in a forest it will be disordered also. If a close order unit enters a forest without forming open order it is forced into a disordered open order. This does not penalize their movement anymore than forests otherwise do.

(2) All units firing from a dense forest do so with the open or skirmish order decrement.

(3) The only exception to this rule is an ambush. If a player sets an ambush he will be able to fire one volley as if he were in close order (this works for all types of infantry, including riflemen). To set an ambush takes three uninterrupted turns. If the ambush is discovered the player may still

fire one volley as close order. While in “ambush” a unit is still considered to be in open order (or skirmish order) for all other purposes. After the volley he reverts to open order (or skirmish) for future volleys.

## 2. Light forests

(a) Light forests have very little undergrowth as well as wider tree growth. They are represented on the playing field with light green felt. Light forests still offer cover and some protection.

(b) Visibility into light forests is limited to 2” from the edge, for those outside looking in. Troops inside a light forest must be within 4” of the edge in order to see or fire out, and visibility inside the forest is otherwise limited to 10.” Troops not within these bounds are invisible as with dense forests. Markers need not be used until someone can come within the visibility distances mentioned. At that time the troops must be placed on the table (markers may be used if the troops are screened). The same exceptions exist to this rule as with dense forests, except that distances are adjusted to those applicable to light forests (a scout can test an area as deep as 10” into the light forest).

(c) Firing inside light forests is identical to that done in dense forests except that the distance is raised to 10”. Troops firing from a light forest must be within 4” of the border.

(d) Movement inside light forests may be done in close order. As with other rough terrain, however, it disorders the troops, but, unlike dense forests, the troops may form up again. As long as they are immobile they may maintain their order.

(e) Light forests are not a superior position, instead they are designated as cover. Light forests do not increase a unit's capabilities (like a superior position does), but being in cover offers a measure of protection from hostile fire.

## E. Rough Terrain

1. Rough terrain slows movement, and disorders formations. Unlike dense forests troops can maintain close order if they do not move across rough terrain. If they move they are disordered.
2. The following is rough terrain: forests (light and dense), plowed ground (with or without crops), rocky or rough ground, rivers, and certain hill faces. The umpire determines in advance if a hill face is rough terrain or not. The biggest determining factor is the steepness. Other variables may also apply.

## F. Rivers

### 1. Types

(a) Fordable. Men and horses may cross fordable rivers without assistance. Fordable rivers are designated by light blue felt. Sometimes, if the ford is hidden, the river will be of dark blue felt but the Umpire will have designated the location of any fords.

(b) Unfordable. Unfordable rivers are designated by dark blue felt.

### 2. Consequences

(a) Troops crossing fords are disordered as a river is considered rough terrain.

(b) Troops crossing rivers are slowed down per **Chart #1**.

(c) All troops while in water, and for the first turn out of water, may only fire ½ of the available points, because their powder is wet.

## IX. Hidden Movement & Losses

### A. Hidden Movement

#### 1. Markers

(a) The most commonly used form of hidden movement is markers. Markers are green discs (or anything else so designated) that are placed on the table to represent units. Usually, one marker will represent one battalion (or regiment of cavalry). In large games a single marker may designate a brigade but the opposition must be informed that such is the case. A marker cannot be used to represent nothing. At least three to four points are required in order for a player to use a marker.

(b) Markers need not be placed on the table when they are: i) more than 48" from the opponent, ii) in a house, iii) behind a hill or forest, or iv) inside a forest or field with high grass. In other words if the unit can be invisible from the opponent no marker need represent that unit. If units are not represented by a marker then the umpire must be informed of their position. This is to ensure that unmarked troops of both sides don't somehow come within 48" of each other.

(c) Troops represented by markers are treated exactly as if they were actually on the playing field. They must have orders written for them and be spaced adequately to allow for their actual size and formation. The player must keep track of which markers represent which units as well as the formation they are using.

(d) When markers are 36" from an opponent the opponent should ask the player to display the troops represented by the markers. The player must display the troops or screen them. This rule does not include troops utilizing any of the terrain mentioned under (b) above. See also section **VIII. Terrain** for a discussion on special terrain features.

(e) When a marker is within 18" of an opponent's line (excluding scouts or ADCs) it must be displayed whether screened or not. This rule does not apply to troops utilizing terrain mentioned under (b) above.

(f) Troops moving from one hidden location to another (such as from house to house) may do so without the use of a marker if the locations are within 6" of each other.

(g) Much energy is consumed in attempts to identify markers. This is fine, however, scouts (1 point stands) and ADCs may not cross the "lines" of the opponent in such reconnaissance efforts.

#### 2. Off-the-board movement

(a) No wargame is presumed to occur in a vacuum. In all cases, unless specifically mentioned beforehand, the battlefield is presumed to continue in all directions beyond the actual playing area.

(b) Movement off the playing area is done as on the table. The only difference is that the terrain is considered to be flat (no roads or rough terrain) unless so designated beforehand. Units that move off the playing area are treated, in every regard, as if they were on a real playing surface. All off-the-board movement must be communicated to the umpire along with the troop formations. The umpire will help keep track of the progress and positions of troops off-the-board.

(c) Combat may not occur off-the-board unless a separate playing area is set up. The umpire may rule that a smaller unit is pushed before a larger unit in order to avoid this. Troops off table may charge directly onto the table.

(d) Any troops or scouts wishing to see off the board must move to within 6" of the edge of the playing area. From this position the troops may see 18" beyond the border of the table. If the scout moves off the table himself he may see 36" from his position.

## **B. Hidden Losses**

1. Casualties need not be removed immediately from the playing area. This rule simulates the fog of war and the difficulty of discerning the exact numbers of the enemy.
2. When a unit has lost enough men to damage the integrity of its formation or otherwise reduce the amount of ground it can cover, then the casualties must be removed from the playing area. Skirmishers, for example, when screening need a certain number of men to screen a certain area. When they take casualties the area they may screen is reduced. In this situation they must be removed. A square, also, may only lose so many men before its integrity cannot be maintained (see section **III. Infantry**). It also must eventually remove its losses.

## X. House to House Fighting and Movement

### A. Firing

1. Each house represents 6 actual houses. This means that the actual features on a house (windows and doors) are symbolic and do not represent actual places at or from which troops must enter or fire. It is assumed that out of six houses there are plenty of windows and doors. For the purposes of these rules the entry point is the center area of every side of any given house.
2. As mentioned under section **VIII. Terrain**, above, houses are rated a superior position #2. As such they offer protection and fire, melee, and morale advantages.
3. When troops first enter a house only  $\frac{1}{2}$  of the points which could normally fire may fire during the first turn in which they occupy the house. After this turn enough time has passed for the men to have loop-holed the building or otherwise got themselves situated.
4. On the underside of each house is a circled number that represents the total number of points that may occupy a building. Along each side of the building is a number that is the maximum number of points that may fire from a side, including loopholes. These same point limitations exist even after the building has collapsed or been destroyed.
5. For houses with two stories  $\frac{2}{3}$  of the house's troop capacity is considered to be on the ground floor. For houses with three or more stories the ground floor is always deemed to have twice the capacity as any other floor. An attic is considered part of the floor immediately below it.
6. Firing from a house is done as normal except the troops firing receive the increment of a superior position #2. All troops firing from a house do so from close order. Troops around the windows and doors are considered to be too crowded for open or skirmisher order. They are not, nor can they be, disordered.
7. Troops firing into a house do so as normal except that they subtract the decrement for firing into a superior position #2.

### B. Melees

1. Melees between troops in a house and those outside are subject to several limitations:
  - (a) Only troops on the ground floor may participate in a melee. As mentioned above,  $\frac{2}{3}$  of the maximum number of troops a two-story house can hold are considered to be on the ground floor.
  - (b) Only as many points as may fire from a given side may participate in a melee.
  - (c) On the outside  $\frac{1}{2}$  of the actual points that are touching the house (or within a  $\frac{1}{4}$ " and two ranks deep) may be included in a melee. No rap around is allowed unless the attacker wants to involve the additional points inside the house that man the other walls.
  - (d) In all melees involving houses, no deduction is taken for disordered troops or troops in either open or skirmish order (whether inside the house or not). This is because hand-to-hand fighting in and around houses is more individual than organizational and formation doesn't matter much. However, formed troops meeting unformed troops on the street will have the usual advantage.

2. The troops inside the house get the increment of fighting in a superior position #2, in addition to line defending. The occupants of a house may not attack without exiting the house, or arrange themselves in any formation besides a line.
3. If the troops in the house win they may elect to exit the house on their bonus move. They can form a column of rout or form a disordered line (the length of which is limited by their movement range).
4. When troops inside a house are forced back they maintain their position inside the house, however:
  - (a) The attacking player may now move his surviving points from the melee into the house. The number of points he may move into the house is limited to capacity of the house or floor, ignoring the number of defending troops that are already there. In this instance it is possible for the total number of troops in the house (both sides together) to exceed the house's capacity.
  - (b) The melee continues in the next turn without either side receiving the increment for SP #2.
  - (c) The defender of the house may reinforce his troops from the other sides of the house (or upstairs floors), up to the number of points involved in the original melee, as long as those other points are not otherwise occupied.
  - (d) Reinforcements from outside the house may enter the fray but each side may only bring its numbers up to the amount in the original melee.
5. Troops defending a house are ejected from the house when they retreat or rout after a melee (or as the result of a failed morale test). Troops on a second floor need not do so, unless the player elects, but may not interfere in the occupation of the ground floor. Troops higher than a second floor may not exit. They are trapped on the upper floors until they can fight through. Melees between floors are limited to two points per side without either side receiving the SP #2 increment.
6. If opposing troops from both sides occupy a house and are fighting over its possession neither side may claim a SP #2 when shaking for morale.

### C. Movement

1. Movement into a house is done normally. Troops proceed to the point of entry and move inside. As many troops as are able may move into a building except where limited by movement distances or by the physical capacity of the house. Points of entry, as mentioned above, are not limited to those windows and doors actually on the house models. The entry point for a house is the center area of any side. For large structures (Forts, Castles, Farmhouses) entry points are limited to those actually visible on the model.
2. Troops moving from house to house may do so without being placed on the board if the entry points of the houses are 6" or less apart. In other circumstances movement between houses is as normal.
3. Troops exiting a house naturally form a column of route (not disordered). If they choose they may form a disordered line (the length of which is only limited by the movement range of the troops). If they run from the house (rout or charge from the house) they will be disordered.

## D. Destruction of a House

### 1. Using artillery

(a) On **Chart #10** select the column that corresponds to the caliber of cannon being fired. Select a row that corresponds to the type of structure of the target. The column to the far right shows what dice roll is required to get a hit. This number may only be adjusted for two modifiers: target and gun unmoved, and close range. Column A gives the number of hits that must occur before additional hits will cause casualties on the men inside. After this point is reached each additional hit on the house also constitutes a hit on the men inside. Column B gives the total number of hits the house can take before it falls in.

(b) Troops inside a house can take hits from artillery fire per above. If a house is destroyed with troops still inside, those troops lose 25% of their points.

(c) The rubble from a collapsed house (whether by artillery or mine) is a SP #1.

### 2. With a mine

(a) Placing a mine requires one point supervised by officers and/or engineers, and takes two complete turns. Obviously, the enemy cannot interrupt this work.

(b) Detonating a mine successfully is determined by a die roll on the part of the umpire. A 5 or 6 means that the mine did not detonate. The player placing the mine may repeat his steps and try again.

(c) When a mine detonates is also determined by die roll. The player planting the mine tells the umpire when he intends to have the mine detonate. The umpire then shakes one die. The results are determined using the following table:

| <u>Die Roll</u> | <u>Timing</u> |
|-----------------|---------------|
| 1               | 2 turns early |
| 2               | 1 turn early  |
| 3, 4            | on time       |
| 5               | 1 turn late   |
| 6               | 2 turns late  |

The umpire does not communicate to either side the results of this die roll. When the turn arrives for the mine to explode the umpire announces to all the players that such has occurred. All mine detonations, unless otherwise specified, occur at the beginning of a turn. Mines have a blast area of 4". Anything inside the blast area is destroyed, including men, horses, and structures.

### 3. With fire

To destroy a house by fire use the Incendiary rules on **Chart #10**. If a carcass is not used its effect may be duplicated by troops inside the house if they take one turn to collect combustibles from throughout the house and supplement it with whatever they have on hand (gin, gunpowder). A mine may also start a fire, but is not quite as effective as a carcass. For more information see the Incendiary rules in section **V. Artillery**. After a house is burning out of control, it is inaccessible for the remainder of the game.

## XI. Obstruction, Construction, and Destruction

### A. Obstruction and Construction

#### 1. Chevaux de Frise

(a) Chevaux de frise must be present on a battlefield from the start; they may not be constructed during a battle. Chevaux de frise are logs tied together which, when viewed end on, resemble an X. The arms that point upward and outward are usually sharpened.

(b) Chevaux de frise are a SP #1. They may be destroyed by artillery fire (see **Chart #10**) or dragged away by cavalry or infantry. At least four points of infantry or two of cavalry are required to drag a chevaux de frise a maximum of 1" per turn.

(c) Infantry may only negotiate chevaux de frise by climbing over it, similar to a rock wall. This takes one full turn and the unit is disordered on the other side. Cavalry may not jump chevaux de frise.

#### 2. Abattis/Hedges

(a) Abattis is both a barrier and a protection. Abattis is made by pulling together all sorts of available material, including: trees, wagons, barrels, crates, and bags of meal.

(b) Abattis may be constructed at the rate of 1" per uninterrupted turn per 5 points of infantry. An engineer officer or sapper/pioneer need not be present.

(c) Abattis constitutes a SP #1. Abattis may be destroyed by artillery per **Chart #10**. It may not be dragged out of the way by cavalry, but infantry can dismantle it at the rate of 1" per turn per 5 points.

(d) Infantry may negotiate abattis as with chevaux de frise above. Cavalry may jump abattis if it is less than ½" high (1" for light cavalry).

#### 3. Hasty Earthworks

(a) Hasty earthworks are crude trenches behind hastily piled earth.

(b) These can be constructed on the battlefield at the rate of 1" per uninterrupted turn per 5 points of infantry. Engineer officers or sappers/pioneers must be present.

(c) Hasty earthworks are a SP #1. Hasty earthworks may be destroyed by artillery fire per **Chart #10**.

(d) Infantry and cavalry negotiate earthworks like rough terrain.

#### 4. Improved Earthworks

(a) Improved earthworks are like hasty earthworks, above, except they are a SP #2. As such they may not be constructed or converted from hasty earthworks during a table battle. For more information on the construction of improved earthworks see section **XII. Campaign**.

(b) Improved earthworks are negotiated as with hasty earthworks above.

#### 5. Formed Earthworks

(a) Formed earthworks cannot be made nor converted from hasty or improved earthworks during a table battle. For more information on the construction of formed earthworks prior to a battle see section **XII. Campaign**.

(b) Formed earthworks are a SP #3. The main difference between the three different forms of earthworks (besides the different SP designation) is the presence of reinforcing timber or stone, or the additional depth and/or height of the walls and trenches.

(c) Formed earthworks, unlike hasty or improved earthworks, are treated as rough terrain or walls/hedges whichever is more appropriate for the situation.

#### 6. Gabions

(a) Gabions were large cylinders (basically barrel shaped) filled with earth.

(b) For construction purposes gabions are treated as formed earthworks, primarily due to the difficulty of obtaining the outside skin during a table battle.

#### 7. Redoubts

(a) Redoubts are essentially a kind of earthwork. As such, they receive the same treatment as improved or formed earthworks, whichever is applicable.

(b) Redoubts may be enclosed with only one exit, or open on one side. They may include gabions or have a reinforced ceiling (e.g. a covered redoubt).

(c) Covered redoubts or redoubts with gabions are classified as formed earthworks and, therefore, may not be constructed during a battle.

#### 8. Pontoon Bridges

(a) If a pontoon train is located with the troops on the table then a pontoon bridge may be constructed at the rate of 2" per 6 points per turn. Each section of 6 points must include at least 1 point of engineers or sappers and the whole project must be supervised by an engineer officer.

(b) If no pontoon train is located on the table a pontoon bridge may not be constructed during the battle. See section **XII. Campaign** for more information on pontoon bridge construction.

#### 9. Bridge Repair

(a) Wooden bridges may be repaired at the rate of 2" per turn per 2 points of engineers. Stone bridges require 4 points of engineers for 2" of bridge per turn.

(b) If a bridge is collapsed in one place the engineers need only repair that section of the bridge.

#### 10. Filling in a Ford

(a) Four points of engineers may fill in a section of streambed 1" wide by 1" deep (1 square inch) per turn.

(b) The umpire must decide if a ford can in fact be created at a given point on a stream.

### B. Destruction

#### 1. Destruction of Structures by Artillery

(a) For more information on the destruction of houses see section **X. House to House Fighting**. These same rules apply for the destruction of larger, or smaller, structures by artillery.

(b) The destruction of structures larger than houses by siege artillery is covered under section **XIII. Sieges** below.

#### 2. Destruction of Chevaux de Frise, Abattis, Rock walls, etc. by Artillery Fire

(a) Use **Chart #10** to determine the number of hits required and what constitutes a hit.

(b) When the artillery has registered the proper number of hits a “breach” 3” wide is the result.

3. Mines

(a) Mines may be used to destroy buildings, earthworks, fortifications, or bridges. For each subject the rules are the same and are described under section **X. House to House Fighting**, above.

(b) Mining and countermining as it relates to siege warfare is covered under section **XIII. Sieges**, below.

4. Fire

Incendiary rules are covered in detail in section **V. Artillery**.

5. Clearing Trees

Four points of engineers may clear a piece of dense forest 2" wide by 1" deep per turn (2" by 2" for light forests).

## XII. Campaign

### A. Introduction

This section is for use as the basic rule set for most campaigns. Individual campaigns may supplement these rules with scenario information, specific rules (including instances in which these rules will not apply), and objectives.

### B. Sequence of Play

A single turn of play will comprise the following parts:

- 1 - Add reinforcements (if any) to roster sheets.
- 2 - Move leaders, couriers, and troops on the map.
- 3 - Adjust for losses due to attrition and poor morale.
- 4 - Destroy or repair bridges, build pontoon bridges, prepare fortifications, lay siege, sap, make loopholes, place abattis, etc.
- 5 - Designate attacks, withdraw, or set down combat on the table.
- 6 - Adjust roster strength for losses or additions.

### C. The Map

#### 1. Basics

(a) All players receive an identical map of the campaign area. Typically these are hex maps but may be of another kind. All players use the maps to keep track of their troop locations and movement. Maps of the early 19th century were notoriously inaccurate, especially the further east one traveled. To represent this the umpire may make some alterations to his map, unknown to the other players (which are binding upon all players).

(b) Each hex will typically represent 3 miles from side to side. Where a non-hex map is used some minor adjustments are required, which should be included in the scenario-specific instructions.

#### 2. Hex map legend (typical)

- (a) Good roads are represented by a solid line.
- (b) Bad roads are represented by a broken line (dashes).
- (c) Large cities are shown with a hex, which is entirely filled in with a grid.
- (d) Small cities are shown as a small grid area inside a hex.
- (e) Walled cities are shown with a border completely around the town.
- (f) Fortresses are shown as a 6-sided star.
- (g) Rivers are like good roads except blue.
- (h) Low hill hexes are lightly shaded.
- (i) High hill hexes are lightly shaded and have a hill drawn in.
- (j) Mountain hexes are lightly shaded and have a mountain drawn in (sharp peak).
- (k) Flat terrain hexes have no feature drawn in.
- (l) Forest hexes are darkly shaded.

#### 3. Terrain

(a) Terrain features shown on the map are very general. A plain hex could contain hills, forests, small rivers, small towns, etc.

(b) The actual terrain in a hex is determined by the umpire upon the request of a player by shaking three dice:

| Red die:                           | White die:            | Green die:    |
|------------------------------------|-----------------------|---------------|
| 0 - flat, no hills, scrub          | - n/a                 | - n/a         |
| 1 - flat, sm. village, sm. woods   | - small castle        | - favorable   |
| 2 - flat, farmland, streams        | - no dominant feature | - neutral     |
| 3 - flat, forested no hills        | - weak farmhouse      | - neutral     |
| 4 - rolling, sm. village and woods | - no dominant feature | - neutral     |
| 5 - rolling, fields, farms, strms. | - strong farmhouse    | - neutral     |
| 6 - hilly, fields, farms, strms.   | - no dominant feature | - unfavorable |
| 7 - high hills, forests, strms.    | - n/a                 | - n/a         |

(c) For a flat terrain hex no modifier is made to the red die (except under certain circumstances where the umpire may decide to subtract one). For other terrain hexes the umpire will add to the red die, as follows:

- +1 - low hills, forests.
- +2 - high hills, mountains

(d) Once the umpire has determined the specific terrain features inside a hex that hex still maintains its original character (flat, low hill, etc.) for map movement. For example, a flat hex is found to be hilly with fields (#6 above). For purposes of movement and visibility on the map that hex will continue to be a flat hex.

(e) The white die is used to determine if any dominant feature exists in the hex in question. The castle must be a smallish castle. A large castle would exert too much influence over a game. The strong farmhouse is like La Haye Sainte (of Waterloo fame), not Hougomont. The weak one is meant to be considerably weaker.

(f) The green die determines favorability. The green die need only be used when both sides happen onto a battlefield at the same time. When one side has a chance to choose the ground the green die is not used. Instead it is highly recommended that the umpire determine the terrain features for a number of hexes and then make a detailed map showing roads, houses, streams, and fields in those hexes. This map is then distributed to the requesting players (and later to all players) so that they can begin to make their map moves in accordance with their desired battlefield positions.

#### 4. Details

(a) Rivers: All rivers present on a map are considered unfordable (depending on scenario). They can be crossed only by bridge and by boat. Usually they are navigable throughout their entire length on the map by vessels no larger than schooner size. Generally, river traffic of a commercial nature (barges, fishermen, etc.) is considered to be continual throughout the campaign. Artillery advantageously placed on a riverbank may command the entire river's width. Rivers may carry supplies. Rivers may also, depending on the scenario and location, have gunboats operating on them.

(b) Towns and Cities: Depending on the scenario and objectives cities may have a point value affixed to them. The last occupying troops will be granted the points for holding a town. Points typically awarded for occupation of various towns are as follows:

|                      |         |                       |         |
|----------------------|---------|-----------------------|---------|
| Town                 | 10 pts. | Walled city           | 35 pts. |
| City                 | 25 pts. | Fortress              | 50 pts. |
| Capitol city add 25. |         | Minor capitol add 10. |         |

## D. Time

1. Each map turn equals 8 hours. Three turns, therefore, equal one day. Every third turn is a night turn (from 10 pm to 6 am). Movement will generally occur during the two-day turns. As will be mentioned in section E. below, movement can occur during the night turn but units so doing may be penalized.
2. For each day/evening of wargaming a battle it is as if a map turn takes place. Therefore, after an evening of gaming if the battle is as yet unfinished a map turn will occur during which the beleaguered players may attempt to reinforce the units engaged in the battle. This will be discussed in greater depth in section M. below. During a night turn combat will generally not occur, however, a map move does take place and units on the table may shift their positions. The foregoing notwithstanding, an umpire can rule that a map turn has not elapsed if only an insignificant number of turns were played during the game.

## E. Movement

1. Normal movement in hexes per turn is as follows:

|                  | <u>Good Rd *</u> | <u>Poor Rd</u> | <u>Flat</u>  | <u>Low Hill</u> | <u>Hi Hill</u> | <u>Mtn</u> |
|------------------|------------------|----------------|--------------|-----------------|----------------|------------|
| Inf, Foot art**  | 3/**             | 2/**           | 2            | 1               | .5             | -          |
| Lt inf, partisan | 5                | 4              | 3            | 2               | 1              | .5         |
| Lt cav, scout    | 6                | 5              | 4            | 3               | 2              | 1          |
| Med/Hvy cav***   | 5                | 4              | 3            | 2               | 1              | -          |
| Supply/Sg Art    | 3                | 2              | 1            | .5              | -              | -          |
| Boats            | Downstream - 4   |                | Upstream - 2 | Lake - 3        |                |            |

Notes: \* Good roads in high hill or mountain hexes are treated as poor roads.

\*\* French infantry (and certain allies- not Westphalians, Saxons, Spanish, Portuguese, Neapolitans, and Danish) moves one additional hex each morning turn. Russians and Austrians (infantry and foot artillery) move one hex slower every afternoon turn, in which they move.

\*\*\* Includes horse artillery.

2. Forced marches

(a) Units wishing to force march may do so. The essence of a force march is to cover more ground in a given period than normal. There are two ways of force marching:

- I. Move at regular speed for 3 consecutive turns (during a night).
- II. Move 1 hex per turn faster during the 2 day turns (or 2 consecutive turns).

(b) Either of the above is one forced march. Rest means that they have been inactive. If the troops fight without resting they will suffer attrition.

(c) Units made prodigious forced marches at different times during the Napoleonic wars. Therefore, since historic precedent exists, it is possible to continue to force march. Units may force march once (one "set" of the above) without attrition loss. However, for each turn thereafter attrition is suffered at an increasing rate. For the second turn of forced march (the fourth consecutive normal move, or the third turn with one additional hex covered) normal attrition is suffered. For the third turn of forced march (the fifth consecutive normal move, or the fourth turn with one additional hex covered) attrition suffered is doubled. This doubling effect continues for each additional turn of forced march without rest. The number of turns of rest must equal the number of turns of forced march.

## F. Attrition

1. Attrition is the loss of strength (points) from non-combat situations. Attrition is suffered when the following situations are met (they are not mutually exclusive):
  - (a) When an army force marches (see section **E.** above).
  - (b) When besieged or besieging (both sides after 15 turns, see section **P.** below). The besieged loses 2 times the normal attrition.
  - (c) When an army has had its supply lines cut for 6 consecutive turns (per turn commencing with turn 7, see section **G.** below).
2. When an army suffers attrition the commander must subtract points from the units involved. The umpire must make sure this happens.

(a) Points lost are calculated according to the following scale:

|             |            |            |            |            |
|-------------|------------|------------|------------|------------|
| FF          | <u>1/2</u> | <u>3/4</u> | <u>5/6</u> | <u>7/8</u> |
| Points lost | 3          | 2          | 1          | .5         |

(b) Troops of FF 7 or 8 will lose 1 point every other turn commencing on the second turn.

(c) Losses shown are spread over two battalions (approximately 50 pts.). Concentrations greater than two battalions (or larger battalions) will suffer losses double or treble those shown depending on the number of battalions. The FF for the two battalions is based on an average. Smaller numbers (1 battalion) suffer correspondingly fewer losses.

## G. Supply

### 1. Necessity of Supply

All units, with some exceptions, must remain in supply constantly throughout the game. This is not difficult as it simply means that the routes (roads, rivers) from an army's depot to the forces in the field must remain open. Supply trains are considered to move along these routes regularly and neither the umpire nor the player need keep track of them. When these supply lines are cut the troops have 6 turns (two days) to reopen or reestablish their supply lines before attrition is suffered (see section **F.** above).

### 2. Depots

(a) Each side establishes depots (in safe rear areas) at the beginning of the campaign. The number of depots will depend on the size of the forces involved. Depots are actually intermediate sources of supply but for our purposes they are considered to be the point of origination (the source as it were) of supplies and may not themselves be out of supply. Depots may be captured and/or destroyed. When that occurs the troops dependent on that depot are out of supply (after 6 turns).

(b) Intermediate depots may be set-up that lie between the main depots and the front lines. These may be cut off from the main depots but are considered to be sufficiently stocked to continue to supply the forward troops for 15 map turns (the same as a besieged fortress). After those 15 turns those troops are considered out of supply. Of course, if the intermediate depots are destroyed or captured then the troops they supply will be out of supply and the usual 6-turn rule applies.

(c) Depots may be shifted or a new one may be established. Shifting a depot involves relocating it. When a new depot is established the old one may be phased out (no longer supplied from outside the campaign)

and the new one begins to send supplies along the new routes. The troops will continue in supply unless one or both of these supply lines is cut. If this happens the army will be out of supply until either the cut route is re-opened or the supply trains moving up the new route reach the army. In this area the umpire must use common sense.

### 3. Cutting supply lines

(a) This occurs when an enemy force of at least 5 points in size occupies a hex through which a supply line passes. To re-open the supply line a force must be sent of at least twice the size of the enemy force (in order to resolve the question on the map). If the 2:1 superiority does not exist then the issue must be resolved either on the map by die roll or on the tables. When the requisite size force occupies an enemy's supply line then the troops at the end of the supply line are out of supply.

(b) When a force is sent to re-open a supply line if the opposition flees (whether along the supply line or not) the supply line is re-opened.

### 4. Effects of unsupply

No effects are felt until 6 map turns have passed (2 days). During those initial 6 turns the unit may move and fight as normal. After those turns the units will suffer attrition for each turn until they reestablish their supply lines. The units may only defend themselves and a forced march will cause double the attrition loss.

### 5. Exceptions

(a) Certain units do not need to stay in constant supply, and therefore are exempt from the above rules. These are: partisans or guerrillas, light infantry, light or medium cavalry on reconnaissance duty (or similarly spread out), and single individuals (scouts, couriers, etc.).

(b) French forces living off the land cannot be out of supply. In order to maintain themselves they must spread out to ½ the concentration normally allowed (see section **H.** below).

## H. Concentration

Concentration concerns itself with how many troops may occupy a hex. Each map hex represents an area approximately three miles in diameter, which is approximately 14' using our ground scale (10" to 100 yards). Virtually a whole army could be dumped into a space that large, however, this kind of concentration can only occur for a battle. Concentrations greater than 200 points of infantry (or 160 points of cavalry) per hex may only occur for the three turns preceding a battle and the three turns following that battle. A concentration may occur for what amounts to two map days. For large cities or fortresses the number of troops may be doubled. If an army concentrates for a longer period than specified above the entire force will suffer attrition losses.

## I. Rosters

Each side is responsible for its own table of organization ("TO", outline of the army's organization from the brigade to army level) and keeping track of its unit's losses. The umpire will check these for accuracy as well as depend on these for his own records. In case players are unable to attend a game it is recommended that as many records as possible (troop strengths, TOs) be kept at the wargame location or the home of the umpire. If a particular player cannot attend a game then the responsibility for his replacement rests with that side's commander and, in his absence, the second in command.

## J. Unpainted figures

The painting of troops has always been strongly encouraged by the Club. For this reason unpainted troops are allowed to move around the map as if they were painted. All troops used on a table must, however, be painted. Unpainted troops who arrive at a battlefield are treated as if they did not exist. This means they may not

be captured or remain off-the-board and perform scouting rolls. If an army, with unpainted troops in attendance, surrenders those unpainted units are surrendered also.

## K. Reconnaissance

If a key to successful campaigning exists it is reconnaissance. There is little as important in a campaign as knowing where the enemy can be found and in what strength. Without effective reconnaissance players will be blind.

### 1. Visible Distance

(a) Troops generally can see from a flat terrain hex into all adjacent flat terrain hexes. Sighting into an adjacent hill or mountain hex will be more difficult and the umpire's discretion is necessary (it depends to a certain extent on the type of troops inside that hex).

(b) Troops on a low hill hex have their vision extended one more flat hex. Troops on a high hill may see three flat hexes away. Finally, troops on a mountain hex may see four flat hexes away. If the adjoining hexes are low or high hills then distances seen will be proportionately less (1 for low hills, 2 for high hills). All sightings are of a general nature only. Specific detail cannot be seen unless the object is inside the same hex. The umpire must use his discretion. When the terrain on a map hex is identified by the shake of the umpire's die the terrain in the hex may have changed, but the map nature of the hex has not changed. A flat hex on the map will always be a flat hex on the map as regards visibility and map movement.

(c) A hex is 3 miles from side to side. Visibility at 3 miles (more if the observer is elevated) can be difficult. Many details are not visible at that range. The umpire will only disclose obvious details of uniform or circumstance.

(d) If the opposing forces are close and maneuvering for battle and the umpire has made a detailed map of the surrounding hexes (as mentioned in Section C.3, above) then the umpire and players should start to use the detailed terrain features when dealing with questions of visibility, screening, and terrain. Use of a detailed map only applies in the limited circumstances mentioned above.

### 2. Screening

(a) To prohibit enemy scouts from seeing your troops a "screen" may be placed between you and the enemy. Light cavalry, medium cavalry, or light infantry may provide a screen. A battalion of light infantry (approx. 25 pts.) or a regiment of cavalry (approx. 19 pts.) may screen two hexes. To penetrate a screen the enemy may move a larger force of infantry or cavalry into the hex of the screening units thereby brushing aside the intervening screen and determining the general nature of what is behind it. If the screening player so desires, however, the screen may fall back and maintain its position between the enemy and the troops being screened. This may not continue indefinitely. Of course heavy infantry and heavy cavalry can "screen" also; such a screen cannot generally be penetrated except by combat on a table.

(b) A single scout may not penetrate a screen. Penetrating a screen with a body of scouts may be done (at least 3 points are necessary). To do so the umpire will shake two dice to determine whether or not the scouts got through. A shake of 2-5 with two dice means that the scouts got through, survived, and can report back. A 2 means he got a "pretty good" look at the enemy. For 3 through 5 less and less was seen as the die roll increases. If the umpire shakes an 11 or 12 it means the scouting party was captured or killed. They must be removed from the campaign.

### 3. Spying

Depending on the scenario spies may be sent out or be in position at the beginning of the campaign. Spy information is, like all information, subject to some inaccuracy. Further, spy information usually takes even longer to arrive in headquarters than information from more usual sources.

## L. Communication

Couriers carry all information between various points on the map. All information sent by scouts (or couriers) more than two moves away from their commander (HQ) must move at the normal movement speed. All couriers move by horse, foot, or boat. Information sent between players if beyond the specified distance from each other must move by courier. Players are to understand that unless the figures representing their persons are close enough to each other on the map they may not communicate directly.

## M. Combat

When the enemy has been located it is every intelligent officer's duty to bring him to battle on terms advantageous to himself. This is the essence of campaigning. Combat generally occurs when two opposing forces occupy the same hex.

### 1. Map Combat

(a) Most combat in a campaign is decided on the tables with the figures, however, some combat may be determined (often by die roll) on the map only. The following situations may be resolved with a die roll:

- (1) Some sieges
- (2) Some ambushes
- (3) Combat by very small forces to re-open supply lines (no die roll needed if 2 to 1 numerical superiority exists)
- (4) Penetration of screens
- (5) Forcing units to abandon a hex (small forces only, see (b) below)

Generally these kinds of combat do not result in losses for either side.

(b) When a great disparity of numbers exists between the two sides the umpire may judge that the smaller side is overrun with loss. Generally the larger side must outnumber the smaller by more than 3 to 1 in order for the overrun rule to take effect. This rule is only applicable to small parties or in circumstances where the outnumbered unit was overwhelmed such that it never had a chance. Units in protected positions (towns, fortresses) cannot be overrun. When a unit is overrun the umpire will shake a die to see if anyone escaped 4, 5, or 6 means someone did escape and notified his superiors. Losses to both sides are determined by the umpire in consultation with the two sides.

### 2. Table Combat

(a) Generally both players must agree to combat for it to occur. The exceptions to that rule are: where an ambush or trap occurs; where the declining player may not retreat due to a river, bridge, or other impeding terrain; where a unit is overrun; or where the attacking player has the potential to move faster or can otherwise force a battle.

(b) When table combat occurs the players should be as helpful to the umpire as possible. This involves specifying or clarifying the units to be involved, specifying, where possible, the location in the map hexes of those units, and being understanding when not everything goes according to their perception. It is difficult to duplicate exactly the map conditions on the table. Each side is likely to feel short-changed in some way. It is natural. Specific instructions to the umpire during map movement will help reduce ambiguity.

(c) Table combat will occur according to this rule set. Usually objectives are not set down for the game because each side has its own objectives based on its goals. Victory therefore is determined as it would in reality, by the respective armies and history.

### 3. Victory Bonus

(a) Victors are allowed to add back losses of 10%, 20%, or 30% (of the start-of-battle strength of a unit, on a per unit basis) depending on the scale or margin of victory. For example, a 20 point unit with 3 points of loss may recover 2 points (if this victory is of a 10% recovery nature). A 30 point unit with 1 point of loss may recover only 1 point. This is allowed because it is judged that these are wounded or missing men who return to the colors.

(b) The loser may add back 10% of losses or subtract 0%, 10%, or 20% from his units (which have taken losses) depending on the scale of loss. This is because, generally, the retreating force will not be able to recover so many wounded and walking wounded men and other stragglers will fall out during the retreat.

(c) Determining the scale of victory is a subjective decision on the part of the umpire. Certainly if it was a close fought engagement where the victor barely edged the loser in a battle of attrition, then the victory should only gain back 10% of his loss and the loser would suffer 0% additional loss. If, in that situation, the loser was allowed to leave the battlefield without pursuit and after some period of collecting wounded he may be able to regain 10% of his loss. However, under no circumstance should the loser regain a greater percentage of losses than the winner. At the other end of the scale, if the victor blew the doors off the loser, who had to retreat from a difficult situation with a high percentage of his units in poor condition, then the 20% bonus and loss would apply. Generally, the umpire should be a little generous with the loser. The 20% loss to the loser should be reserved for rare occasions. The victor may recover 20% (30% would be rare) more frequently. Among the factors the umpire should consider are: relative losses to each side, amount of fresh or pretty undamaged cavalry available to each side, number of fresh troops, number of total troops, number of shaken or panicked units, and how difficult the retreat will be for the loser.

### 4. Reinforcements

(a) Units in close proximity to a battle may enter that battle during play. For example, the players move to contact during the 7<sup>th</sup> turn (a morning turn). During the 8<sup>th</sup> turn the battle is joined. Units not at the battle site at the beginning of the battle (beginning of the 8<sup>th</sup> turn) may attempt to reinforce the units on the table based on the following schedule:

Reinforcement Schedule  
Number of Map Hexes Removed from Combat Hex

| Type:        | <u>1</u> | <u>2</u> | <u>3</u> | <u>4</u> | <u>5</u> | <u>6</u> |
|--------------|----------|----------|----------|----------|----------|----------|
| Inf./Art.    | 5th      | 8th      | 11th     |          |          |          |
| Light Inf.   | 3rd      | 5th      | 7th      | 9th      | 11th     |          |
| Hvy/Med Cav. | 3rd      | 4.5      | 6th      | 7.5      | 9th      | 10.5     |
| Light Cav.   | 2nd      | 3rd      | 4th      | 5th      | 6th      | 7th      |

- Number shown is the turn in which they march onto the table.
- Bad roads or moving cross-country lengthen the time interval.

(b) As mentioned above (section **D.**), a battle may endure more than one map turn when it carries over into a second evening of play. The umpire will determine if such is the case. When this occurs the players may make the map move which was going on during the game (except those units which arrived as reinforcements, arriving was their map move). Continuing with our example, the 8<sup>th</sup> turn ends without a decision, which means the battle will continue into the 10<sup>th</sup> turn (the 9<sup>th</sup> turn is a night turn). All units

that have not already moved the 8<sup>th</sup> turn may make that move. Further, since a night turn occurs, troops may move during the night. Those troops that fought on the 8<sup>th</sup> turn may move only minimally during the night or they will be exhausted on the morning of the 10<sup>th</sup> turn. The battle will resume on the morning of the 10<sup>th</sup> turn. As mentioned, troops that are close as of the beginning of the 10<sup>th</sup> turn will be able to join the battle according to the above schedule.

## 5. Losses

(a) Points lost during a battle, except as mentioned above (i.e. recovered by the victory bonus), are lost for the duration of the campaign and may not be recovered. Accurate records must be kept. The only exception can occur when troops are involved in more than one battle in which they are victorious. In the first battle they lose more points than they are able to recover through the victor's bonus. So going into the second battle they are not full strength. After the second battle they may recover 10% or more (whatever it is) even if this means they recover some losses from the first battle.

(b) Mounted officers lost are generally replaceable, except for named generals. Generals who are lost are gone for the campaign and a new general must be painted to replace him (if an unemployed one does not already exist) or the units under his command must in some other way receive a commander. For example, lost divisional commanders can be replaced by having the senior brigade commander command the division as well as his own brigade. This sort of arrangement happened often enough in reality. The morale effects of losing officers do not continue into other battles.

(c) Flags lost during a battle are a morale problem during that battle only and do not carry over into other campaign battles or issues.

(d) Artillery pieces lost in a battle may be gone for that battle only or for the entire campaign (see **Chart #9**). If an artillery piece is captured it is gone until you capture one yourself.

## N. Boats and bridges

### 1. Boats

(a) Boats may be commandeered, damaged, burned, or brought to one riverbank. They may be destroyed or damaged in ½ turn and repaired in 3 turns. Naval personnel or civilians knowledgeable in such things must be present in order to repair them.

(b) It takes one full turn for units to be loaded or unloaded from boats. To cross a small river by boat will require one turn to load, a small fraction of the next turn to cross, and the remainder of that turn to unload. The whole operation can be done in 2 moves. Movement up and down a stream is as explained in section **E.** above.

### 2. Bridges

(a) Movement across bridges for a regular concentration of troops (5-8 battalions/hex) takes one full turn. If the bridge is a small one (as judged by the umpire) then movement across the bridge takes twice as long.

#### (b) Demolition of bridges

(1) Placing explosive charges requires a minimum of one turn. With one turn of preparation the umpire shakes a die and a 1 or 6 result means the charge did not damage the bridge. If additional turns are used to prepare the explosives a 1 on the die roll means the charge did not damage the bridge. Additional damage can be incurred if this procedure is successfully repeated to the same bridge.

(2) Bridges may be repaired in 6 turns if not disturbed by the enemy and if additional damage was not incurred (3 more turns if additional damage). On the 7th (or 10th) turn the bridge will be usable for traffic.

(b) A pontoon bridge can be constructed in one turn if a pontoon train is present. Additional bridges will require an extra turn per bridge. If a pontoon train is not present materials must be collected before a bridge can be constructed. If a town is nearby (within 3 hexes) the material may be collected in one turn (per bridge). If a town is not nearby the material will require 3 turns per bridge to be collected. The entire procedure would, therefore, take 4 turns per bridge if no town is located nearby. Except when using a pontoon train, two bridges may be constructed simultaneously as long as adequate troops and engineers are present. At least 3 points of engineers are required per bridge.

(c) Movement across a pontoon bridge is  $\frac{1}{2}$  as fast as a normal bridge. Two pontoon bridges, therefore, are required for normal movement.

## O. Fortifications

### 1. Field Fortifications

(a) Field fortifications were not used as much during the Napoleonic period as, for example, during the American Civil War. Since they were used, however, provision for their construction is made here. Unless otherwise mentioned the type of improvements made are generally earthworks (without wood support), chevaux de frise, or other fairly simple devices.

(b) Gun emplacements (SP #2) are made automatically by artillery units, which remain in the same map hex for 3 full turns.

(c) Terrain improvements (earthworks of SP #1 or #2) may be made by infantry (without the help of engineers or sappers) who are allotted to that work for a number of turns. The works will continue to improve for each additional turn in which work is accomplished. If only two turns are available only abattis or hasty earthworks (SP #1 improvements) are possible. If 3 or more turns are available improved earthworks (SP#2) are possible. Even with several turns of work these improvements are not spectacular. Extrapolation of the amount of earthworks that can be done during a table battle (based on so many table turns to a map turn) is inappropriate. The extent in inches of the improvements depends on the number of troops working on the project and the time period available. As a guide, one battalion may produce a stretch of SP#1 earthworks (equal to the unit's own length when in line) per map turn. In order to turn this stretch of earthwork into a SP #2 they must invest a further 2 turns into the same piece of ground.

(d) Improved earthworks (SP #2) are subject to the same restrictions as item (c) above. At least three full turns are required. Again, in two turns, only improvements of a SP #1 nature are possible.

(e) Formed earthworks (SP#3) require the presence of sappers beyond those presumed to be already attached to a unit. Formed earthworks include reinforced redoubts, gabions, or reinforced earthworks. Construction of a tolerable redoubt requires 6 map turns and the presence of engineers.

(f) Fortified structures (SP #3) may not be built without Engineer officers, sappers, skilled labor (available from a town probably), and lots of unskilled labor. The time period required to build this kind of structure is a minimum of 30 map turns (this gets you a smallish blockhouse with brick and stone reinforcements, not a Vauban fortress). Buildings or fortresses of more impressive size cannot be completed during a campaign.

## 2. Fortresses

Fortresses are designated as such on the map, and cannot be constructed from scratch. Walled cities also qualify as fortresses although they are not as strong. Outworks or improvements to the actual fortification or walled city may be made according to the time schedules above.

## 3. Log Booms

Log booms were often placed across harbors. During a campaign four points of engineers may construct 4" of boom per campaign turn. They cannot be interrupted.

# P. Sieges

The essence of a siege is to: (1) blockade a fortress (or other stronghold) and deny it supplies, (2) reduce its fortifications through artillery or mines, and (3), storm the fortification, if necessary.

## 1. Map or table

(a) Sieges are primarily a map activity due to the length of time required to effectively prosecute a siege. The umpire, at the request of the besieging player, declares a siege. In order to besiege something the besieger must blockade all entrances and exits. A minimum number of troops is not required. However, if the siege is between minuscule forces for possession of an unimportant village the umpire may determine that the situation is a stalemate and perform no further action.

(b) The following activities of a siege are conducted on the tables: assaults, sorties, escape attempts, and relief attempts.

## 2. Concentration

As mentioned under section **H.** above, fortresses and walled cities can support troop concentrations of two times the normal limit (10-16 battalions instead of 5-8). The besieger must spread out his troops so as not to exceed the normal concentration limits.

## 3. Attrition

Attrition will not affect either side until 15 turns have elapsed. At that point the besieged player is thought to be out of supply. He will suffer two times the normal attrition. The besieger will suffer normal attrition after the 15 turns.

## 4. Map Combat

When the siege begins the besieger and umpire are responsible for keeping track of the losses inflicted on troops (both sides) and the damage to the structure of the fortification as well as the progress of the siege works.

### (a) Artillery

(1) Each turn of the siege the besieger has the umpire roll dice to determine the success of each cannon. The besieged player may also fire from the fortress at the siege works or siege artillery. The Artillery Fire against Structures chart (**Chart #10**) is the chart used to determine hits and damage to the fortress. For each cannon the results are multiplied by 10 (to represent the minimum amount of firing that can be done in 8 hours). For each map turn of fire where neither the target nor the gun was moved add a 1 to the dice roll for the gun. Firing from protected positions increases the dice roll for each gun by 1. Counter battery fire by either side is allowed. Destruction of the target according to the chart results in a "breach" about 3" wide. Therefore, to create a practicable breach at least two stretches 3" wide are necessary. Firing artillery is an activity that will cause a forced march if done for more than 2 consecutive turns. Do not disregard anti-personnel hits. However, they will not occur if the players are keeping their men out of harm's way.

(2) The number of cannon in a fortress or walled city varies depending on the situation. Most fortifications of the time were outfitted with some small bore or obsolete cannon. Unless the defender has taken steps (previous to the siege) to outfit the fortification with adequate large bore cannon the assumption is made that the fort is not well stocked with that kind of gun. Of course, the more imposing or important the fortification the more likely it is that it will be prepared. A walled city, for example, is not likely to be particularly well armed. However, a fortress like Danzig is very likely to be pretty well stocked from the start. The umpire will determine the defensive state of fortifications upon request.

(b) Mines. When the besieger has brought his parallels (see item c) to within 18" of the defender's walls he may attempt to mine the walls if he has at least one company of sappers or engineers attached to the besieging force that is not otherwise occupied. Mining involves placing a large explosive in a buried position under the walls. Its detonation is supposed to cause the wall to fall. To place a mine the players must do the following:

(1) The besieger must tunnel from his parallel to the wall. Sappers and miners must do the tunneling. They can tunnel 6" per turn per 8 points (the maximum number that can work in one tunnel each turn).

(2) When the tunnel reaches the wall one turn is required to place the mine.

(3) The umpire shakes two dice. The first determines if the mine was placed correctly. A 1 or 2 on one die means the mine was poorly placed. Its detonation will not destroy the walls but will destroy the last 12" of the tunnel. The second die determines if the mine detonates. A 5 or 6 on this die means the mine does not detonate. If this is the case the player may take another turn to re-prepare the mine. He can then try again. If the mine detonates a breach 6" wide is created in the wall. The defender may replace this section with a barricade (SP #2) built according to the schedules in section O. above. For more information see the mine section in **Section XIII Siege Warfare**.

(4) The defender may try countermining. This is subject to the same rules as mining. The defender must make a guess as to where the besieger's tunnel is. He then sends his tunnel out to intersect. He can hear the besieger digging if he gets within 6" of where they are working. His counter mine will destroy the last 12" of the besieger's tunnel and kill anyone inside it if they are there at the time of detonation. His mine must be placed within 3" of the besieger's tunnel.

(c) Parallels. A company of sappers or engineers is required to lead the work on any set of parallels. Parallels must begin outside the range of the garrison cannon. Each turn a section of parallel can be dug that is 12" long. For every 20 points of infantry (plus one company, 3 to 5 points, of sappers) that is not otherwise occupied a different 12" of parallel can be dug. Parallels may not come closer than 12" from the fortress's walls. The defender may fire at the parallels with success determined by **Chart #10**, target classification - earthworks).

## 5. Table Combat

On any turn after a siege has been declared either side may request a table battle. The besieger must specify to the umpire where his troops are located around the fort. If the besieged sorties, the besieger has the option of beginning his assault on the fort. Artillery fire to and from the fort may continue during any table battle.

### Q. Guerrillas

Partisan or irregular units were common during the Napoleonic wars. In each campaign scenario the level of partisan activity should be determined. Therefore, the following rules are only a guideline and can be supplemented where necessary.

1. Guerrillas will move as true skirmishers. They are considered to have mountain climbing ability. The smallest unit the umpire is required to keep track of is 5 points (of Guerrillas).
2. Guerrillas are not subject to supply line limitations.
3. Their fighting factor for morale and fire purposes is 2. For other purposes it is 4.
4. Guerrillas are automatically assumed to have all knowledge of trails, fords, and other physical terrain.
5. Guerrillas may be forced from a hex when faced with enemy troops with a superiority of 2:1.
6. Ambushes of couriers, supply trains, and small bodies of infantry or cavalry may be done on the map utilizing a die roll as follows:

5,6 Ambush successful, ambushee escapes but loses 25% of points.

3,4 Ambush slow, both sides lose 25% of points. Dice 4,5,6 to see if courier gets away.

1,2 Ambush fails, Guerrillas lose 25% of points.

Subtract 1 from die roll if ambushee has 2:1 superiority. Subtract 2 from die roll if ambushee has 3:1 or greater superiority.

7. Surprise attacks of larger bodies of troops are fought on the table. Surprise attacks are simulated by allowing an unanswered volley or by reduced effectiveness on the part of the surprised side. When an attack is begun a die is thrown to determine if the Guerrillas get a bonus: during the entire game (5 or 6), only during the first turn (3 or 4), or not at all (1 or 2). The bonus affects melee and firepower effectiveness. The bonus can be an additional one or two added to all dice rolls, for example.
8. Regular light infantry operating behind enemy lines may have all of the above apply, except the FF.

### R. Victory Conditions

Victory conditions are determined for each individual campaign scenario. By way of guidance the following can be used as possible bases for victory:

1. Number of battles won (all major battles earn a set number of points, minor battles earn less).
2. Extent to which the enemy army has been defeated.
3. Number of principal towns or, better yet, enemy capitals occupied.
4. Amount of enemy territory occupied.
5. Mutual consent or one player suing for peace.
6. Other possibilities plus any combination of the above.

## XIII. Siege Warfare

### A. Introduction

Siege warfare was a systematic method of reducing a fortress with the intent of eventually taking it, either by storm or by its eventual surrender. In the Napoleonic wars sieges occurred frequently. Given the fact that by this point in history no fortress could withstand a well-prosecuted siege, sieges were usually something of a sideshow. Fortresses were only a second line defense and could never be used to win a war.

In these rules sieges will most often be prosecuted in conjunction with a campaign. Therefore, the reader is advised to follow the siege rules located in section **XII. Campaign** as well as those located here.

### B. Preparation for Assault

#### 1. Parallels and Saps

(a) Sapping is the name for the actual digging of the trenches around a fortress (or part thereof) which is being besieged. The first trench is called a parallel. It is a concentric ring running roughly parallel to the walls of the fortress. When the first parallel is completed a trench is dug (called a sap) forward toward the fortification where another parallel is established. The saps use a zig-zag approach so that the trench cannot be enfiladed by fire from the fortress. In this way the parallels move forward toward the fortification allowing siege artillery, men, and material to approach in relative safety. Major trenches are usually lined with gabions and fascines, earth filled barrels lined with wicker or straw, as reinforcement and protection. The parallels and saps also connect redoubts (usually covered) that house the siege artillery.

(b) Parallels and Saps can be dug at the same rate as hasty earthworks (as described in section **XI. Construction**, 1" per turn per 5 points of infantry, at least 1 point must be sappers or pioneers. Trenches dug during a table battle are a SP #1.

(c) As mentioned in section **XI. Obstruction, Construction, and Destruction** above, improved or formed earthworks, which include gabions and fascines, cannot be constructed during a table battle. Please refer to section **XII. Campaign** for information on the construction of formed earthworks.

(d) Men and material move through trenches as through rough terrain.

(e) Trenches may be destroyed by enemy mortar or cannon fire, or through enemy mines. Use **Chart #10** to determine the success of artillery fire against trenches. See the mine rules under section **X. House to House Fighting** to determine the success of any mines.

#### 2. Breaching the Walls

(a) Siege cannon are used to reduce or breach fortresses. Siege guns are usually 18 pdr. cannon or greater and mortars of at least 11".

(b) Breaches are a collapsed section of wall. A section is breached when the siege guns have obtained enough hits to cause it to collapse.

(c) Hits are calculated using **Chart #10**, as with firing at a house the only adjustments to the dice roll that apply are close range and target and gun unmoved, see (d) below. Destruction of the structure per **Chart #10** means that a breach 3" wide is created. Obviously, more than one 3" wide breach is needed before an assault is possible.

(d) Accuracy of siege guns can be improved in two ways:

(1) The dice roll can be increased by 1 when the cannon are within close range. Close range is  $\frac{1}{2}$  effective range.

(2) A 1 may be added to the dice roll for each turn in which neither the target nor the gun were moved from the previous turn.

(3) Siege guns can be quite accurate if well positioned.

(e) When a breach is made that section of the wall collapses. One breach (3" wide) will have debris at the bottom of the wall 4" from the original base of the wall. The debris slopes back to a position 2" back from the original top edge of the wall.

(f) Troops and cannon on the wall when it collapses are lost.

(g) Immediately after a breach is made the top of the breach is a SP #1. During a table battle troops on the parapet may not improve this to a SP #2. If different sections of a wall have different SP factors an average may be used if necessary to simplify calculations.

### 3. Firing from/to a Fortress

(a) Infantry firing from fortress walls do so from a SP #3 (except in a breach). Troops on the walls may not fire straight below them; the enemy is protected up to 3" away from the wall. If the defender wants to expose himself and fire into this 3" zone he may do so but he becomes a SP #2 target instead of SP #3.

(b) Cannon firing canister or ball at assaulting infantry may not depress their muzzles sufficiently to fire within 10" of the base of the fortress.

(c) Soldiers firing small arms at a fortress may fire more than two ranks deep depending on the height of the walls and their distance from them.

(d) Cannon firing at a fortress may fire at the troops on the parapet, but must reduce their dice roll for the protection the fortress offers (SP #3). Of course, they most likely will be able to increase their own effectiveness if they are in a SP #2 or #3.

## C. Infantry Assault

### 1. Leaving a trench

(a) It takes infantry  $\frac{1}{2}$  turn to traverse or climb up from a trench.

(b) All units that must cross or climb out of a trench are disordered.

### 2. Breaches

(a) Infantry climbing a breach traverse the rubble as if it were rough terrain and are disordered.

(b) They may form up at the top, or at any time en route.

### 3. Ladders

(a) Infantry may bring ladders with them. Miniature ladders need not be placed with the figures.

(b) The player must declare to the umpire and the opposite side which units are carrying ladders.

(c) An entire company climbs ladders at the same time. Each turn the company climbs 2" of vertical. At the top it takes ½ turn for the company to get off their ladders. At that point the unit/company is disordered. The fort's defenders must melee any troops using ladders during the turn when the attackers get off the ladders. If the defender does not attack during that turn he will no longer have a SP advantage in the melee.

#### 4. Melee

(a) As assaulting infantry approach a fortress a Pre-Melee Morale test is performed. This test can be difficult for the assaulting unit(s) to pass.

(b) After both sides pass the Pre-Melee Morale a melee may occur. Units climbing ladders or a breach are disordered, unless they have taken the time required to form up. In addition, if they are opposed at the top then the opponent is granted additional increment for the SP (#1, #2, or #3) which he occupies. The unit(s) on the walls will probably have no penalty for disorder (although it is possible).

(c) Troops climbing into the fortress must first win a melee (forced back is acceptable) in order to clear a space for themselves on the parapet. Until they win, and in every melee they fight, the defender has the advantage of the SP. This does not apply if the defender has pulled back or in some other way has not immediately engaged the attacker.

(d) When the assaulting troops win a melee (and therefore gain space for themselves on the parapet) they may use their bonus move to either form up or bring additional troops onto the parapet, not both. As with a normal bonus move, up to two units charging in support may also bonus move by advancing at the quick step (adjusted for difficult terrain), for infantry.

(e) If the assaulting troops are defeated in a melee a retreat or rout means they must retreat the regular distance (adjusted for the difficult terrain) down the breach or their ladders. A forced back means a 2" retrograde down the breach or a 1" descent down the ladders. The victorious troops on the parapet may bonus move (no units may bonus move in support). If they descend the breach (they may not descend ladders) they will only have a SP #1 in their favor.

(f) A fort's defenders surrender when the player decides to surrender or when all his units are at panic level. This last is a technical surrender and is designed to keep a player from fighting to the bitter end. The player may also try to retreat from the fort in order to save his men.

### D. Sorties

#### 1. Leaving a fortress

(a) A fort's defenders may sortie from any fortress door. They may move through the door without any movement penalty.

(b) As long as the sortie is in column formation (single company width) it is not disordered as it leaves the fort.

#### 2. Firing to/from trenches

(a) Troops firing from a trench receive the advantage of either a SP #1, #2, or #3 depending on the type of earthwork they are firing from. See also Section **XI. Construction** for more information.

(b) Troops firing at a trench are penalized for firing at a SP.

## 3. Attacking a trench

(a) Troops defending a trench receive a SP advantage in any melee or Pre-Melee Morale test. The SP they occupy depends on the factors discussed under item 2 above.

(b) All movement traversing or climbing into or out of a trench takes  $\frac{1}{2}$  move.

**E. Mines**

## 1. Mining the walls

(a) To mine a fort's walls a tunnel is dug from the nearest parallel to a point intersecting the wall. Only miners or sappers may dig the tunnel. They dig at the rate of  $\frac{1}{2}$ " per 8 points per turn (the maximum number of points which can work in one tunnel). See section **XII. Campaign** for information concerning mines in a campaign siege.

(b) The besieging force must inform the umpire where the tunnel commences and where it will intersect the wall.

(c) When the tunnel has arrived under the wall the mine can be placed. Placing a mine requires one point supervised by officers and/or engineers, and takes two complete turns. Obviously, this work may not be interrupted by the enemy.

(d) The umpire determines in advance when, if, and where a mine explodes (three separate die rolls). This information is not passed along to the players until the mine detonates.

(1) The possibility always existed that the tunnelers would not place the mine directly below the wall. To allow for this possibility the umpire shakes one six-sided die. A 1 or 2 means the mine was not placed correctly (it will not damage anything except the last 12" of the tunnel it was in).

(2) The next difficulty in placing a mine is getting it to explode. A result of 5 or 6 on a six-sided die means the mine did not go off. The sappers may make another attempt.

(e) When a mine detonates is also determined by die roll. The player planting the mine tells the umpire when he intends to have the mine detonate. The umpire then determines when the mine will actually explode according to the following schedule:

| <u>Die Roll</u> | <u>Timing</u> |
|-----------------|---------------|
| 1               | 2 turns early |
| 2               | 1 turn early  |
| 3,4             | on time       |
| 5               | 1 turn late   |
| 6               | 2 turns late  |

When the turn arrives for the mine to explode the umpire announces to the players that such has occurred. All mine detonations, unless otherwise specified, occur at the beginning of a turn. A section of wall 6" wide collapses above the mine, creating a breach. Everything (troops, artillery, etc.) on the collapsed wall is lost.

## 2. Countermining

(a) A fort's defenders may deter mining attempts by digging their own tunnels in the hope of intercepting one of the besieger's tunnels.

(b) In all aspects of the above rules the defender's tunnels have the same requirements as the besieger's. The umpire will plot the paths of all respective tunnels to determine if any will coincide. The two tunnels can hear each other digging if they get within 6".

(c) If a defender's tunnel intercepts a besieger's tunnel a melee occurs. Two points per turn per side may melee. No Pre-Melee-Morale need be calculated. If the besieger's have placed their mine and vacated the area, the defenders may extinguish the fuse in one turn. If the mine goes off, well the counter miners are gone, with their tunnel.

(d) The defender may also place his own mine in the hope that it will destroy the besieger's tunnel. If his mine detonates successfully (it must be within 3"). It will fill in the last 12" of the besieger's tunnel and kill all men working inside it. Mining and countermining was not for wimps.

## XIV. Amphibious and Naval Rules

### A. Introduction and Explanations

1. **Chart #11** has basic information about boats and ships. The umpire, however, must judge the appropriateness of the information presented therein. For example, according to that chart boats hold 14 points. It is very likely that a model of a boat (used in a game) could not hold that many points. In that situation the umpire will rule how many points it can hold and any other changes to the chart that are applicable to that particular boat.
2. Boats are by nature more frail than ships. They cannot withstand shot as well, and they cannot mount cannon heavier than a 9 pounder (6 pdr. or smaller guns only in smaller boats). Specially built gunboats could mount a 24 or 36 pdr. in the bow, but these are only typical in harbors. Their use will require special preparation.
3. Boats only qualify as a superior position #1 to those inside. Ships on the other hand provide a SP #2 or #3, depending on which deck the men occupy. Lower decks (including gun decks) receive a SP #3. Decks that are open to the sky receive a SP #2.
4. Oarsmen are required to propel boats but for simplification's sake these rules totally ignore them. These rules also ignore problems with rudders/steering, crews, sandbars, and seasickness. It is thought that games are more enjoyable if a player is not concerned with his soldiers keeping their lunches down.

### B. Unloading and Loading

1. Loading troops into a boat
  - (a) Troops climbing into boats from a shore (not aided by a pier or wharf) require 4 full turns to get seated. If the boat holds more than 15 points add one turn.
  - (b) Troops using a pier or wharf to embark require one less turn than above.
  - (c) Troops climbing from a large ship (troopship or ship of the line) into boats require 6 full turns (8 if the boat holds more than 15 points).
2. Unloading troops from a boat
  - (a) In general disembarking troops takes less time than embarking them. Disembarking on a beach or wharf will take ½ the amount of time referred to above.
  - (b) If the water shallows too much, large boats may not come right up to the shoreline. If such is the case the men must unload in the shallows and wade. The umpire will determine where shallows are. Movement in shallows is treated as rough terrain for movement and orderliness.
  - (c) Troops may not reform until they reach the beach, shoreline, or very shallow water (less than 1 foot).
  - (d) A boat may be manhandled to shore by ½ of its occupants at the rate of 2" per turn. A boat may be manhandled through shallows. The troops manhandling the boat may not participate in any other activity. Men in the boat may fire over their heads.
  - (e) Men in a boat are treated as in SP #1 as long as the enemy is in a position roughly level with the men in the boat. If the enemy is elevated enough to easily see or shoot over the boat's gunwales then the position is compromised.

(f) During and for the first turn after any water contact a unit may only fire  $\frac{1}{2}$  of its men. The troops must be wading or swimming in order to have contact.

### C. Artillery Fire

1. Artillery fire from shore may target only the boat or ship. Every hull hit on a boat is a hit on men inside the boat.
2. When damaged sufficiently a boat will founder causing all its occupants to swim. Casualties to swimming troops (unless in designated shallows) occur at the rate of  $\frac{1}{2}$  of the points every turn. Therefore, 75% of swimming troops are lost in two turns (the losses continue until the troops are helped). Another boat may pause to lift men in or allow them to hold onto the gunwales.
3. During that first turn when a boat receives enough hits to sink it is considered to be breaking-up. At the beginning of the next turn the men are actually in the water and trying to swim.
4. Use **Charts #9** and **#11** to determine hits against boats or ships. **Chart #9** is used to calculate if and how many hits occur on a boat. Use the CO and CR/CO columns for ball on this chart. The player must decide what part of a ship he wants to target (rigging or hull). **Chart #11** is used to determine how many hits are required to sink or otherwise disable a boat or ship. The number of hits required is calculated based on the assumption that a 24 pdr. does the firing. For smaller and larger cannon the number of required hits is adjusted as per **Chart #11**.
5. With boats (not ships) every hull hit is considered to be a waterline hit because of the boat's relatively small freeboard. **Chart #11** shows that only two hits are required to sink a boat. The rule which requires one point of crew loss for every three hull hits does not apply to boats, instead each hull hit on a boat requires one point of loss on the men inside.

### D. Firing from Ships

1. A ship's armament is determined beforehand. It may only fire from the broadside except when bow and stern chasers are present. The guns on the broadside have an arc of fire up to 20 degrees on either side of a line exactly perpendicular to the ship's axis. Bomb ketches must align themselves in the direction their mortar is pointed (usually straight ahead).
2. All fire from a ship is done as normal for artillery. Where large numbers of guns exist they may be fired in groups with the results multiplied by the number of cannon firing. Any SP (as determined above, section **A.**) is taken into account when firing. If the ship is unanchored it must subtract one when firing.

### E. Movement

#### 1. Basics

**Chart #11** sets out the basic move for all kinds of watercraft. This movement allowance is adjusted for the following factors:

- (a) A current adjusts the movement allowance up or down as much as 4" depending on the strength of the current.
- (b) Movement is increased or decreased based on the direction of the wind relative to the ship (for ships using sails). The basic move assumes a wind direction from the rear.

(1) For square rigged ships: movement increases by 25% for wind off the after quarter or beam, decreases 50% for wind off the forward quarters, and decreases to zero for wind dead ahead. No square rigged vessel may come nearer the wind than 45 degrees.

(2) For fore-and-aft rigged vessels: movement increases 25% for wind off the stern quarters or beam, and decreases 25% for wind of the fore quarters. These ships may come as close as  $22\frac{1}{2}$  degrees to the wind.

## 2. Ships may be towed or kedged

(a) Any ship may be towed at  $\frac{1}{2}$  its basic movement. It takes four turns to swing out a ship's boats and prepare a line.

(b) All ships may kedge at  $\frac{1}{4}$  of its basic movement. Again it takes four turns to make the necessary preparations.

## 3. Anchors and springs

(a) Ships may anchor using springs that will enable them to swivel in place. To anchor on springs (whether by bow or stern must be specified) requires six full turns. After that the ship can swivel in place up to  $22\frac{1}{2}$  degrees per turn.

(b) Anchoring allows more accurate fire (as mentioned above under **D.**). It takes one turn to drop an anchor.

## F. Miscellanea

1. Log Booms may be constructed across channels or rivers to block the passage of ships and boats. To construct requires adequate engineers and materials (very large logs and chains). These may not be constructed during a table battle. During a campaign four points of engineers may construct 4" of boom per campaign turn. They must be otherwise unoccupied.
2. Booms may be destroyed or rendered ineffective by the following:
  - (1) A party (must include a naval officer or engineer) may set a charge to the log where it and the chain join. See section **X. House to House Fighting** for detail on the rules governing mines.
  - (2) Explosion ships may be used to destroy a boom. Explosion ships use a modified mine to destroy the target. Therefore, the rules governing mines still apply.
3. Fire ships require four turns to be prepared, set on fire, and set on course. The course must be in a straight line. Current and wind will complicate the direction a fire ship will travel. The umpire must adjust the movement of a fire ship accordingly. Any ship touched by a fire ship must contain the fire in two turns or be abandoned.
4. Repairs to ships may be accomplished during a game. One hit may be erased for every four turns of dedicated uninterrupted work. The ship may not maneuver or take fire during this time. Jury rigs require ten turns but will allow a dismantled ship to move  $\frac{1}{2}$  speed.

## XV. Native American Rules

### A. Introduction and Explanations

1. With some exceptions, such as Tecumseh, Native Americans were highly fickle and unreliable, according to European standards. They became easily disheartened and resentful. They resemble violent children, easily aroused and just as easily disgusted and prone to go home if not continually motivated. These rules attempt to portray their strengths and weaknesses.
2. Unlike the other aspects of this rule set this section is very specific in its geography and scope. Native American rules are specifically written for the War of 1812 or other hypothetical conflict on the North American continent. Some factors, such as treatment of individuals (Tecumseh for example) are very specific.

### B. General

1. Although castings of natives are shown with any number of arms, for these rules each is assumed to be armed with a trade musket as well as knives and tomahawks. They fire muskets using a FF 2.
2. For melee purposes Native Americans are treated as a FF 6. The presence of chiefs will add one to their FF. Tecumseh will add two to their FF. The usual treatment of leaders in melee will apply for white officers (Major or above) or Indian agents. For Pre-Melee Morale purposes the above FF will apply.
3. Native Americans always fight and fire in skirmish formation. They are the ultimate true skirmishers.

### C. Movement

|            | Open<br>Country | Light Woods<br>Rough Country | Dense Woods<br>Swamps |
|------------|-----------------|------------------------------|-----------------------|
| Walk       | 8"              | 6"                           | 4"                    |
| Dog trot   | 12"             | 9"                           | 6"                    |
| Run/Charge | 18"             | 12"                          | 8"                    |

### D. Morale

1. Natives for morale purposes are treated as a FF 2. Chiefs present when morale is tested will add one to the FF. Tecumseh will add two. White leaders (Majors or above and Indian agents) will impact morale as normal. When a chief is killed the FF, of course, is no longer augmented. Further, the natives must shake for morale subtracting the normal amount from the dice roll.
2. Victories and losses will affect the morale of all Native Americans. If they are on the losing side of a battle all natives on that side will desert. The only exception exists when Tecumseh is present. When he is there 25% will stay with him. Victorious natives leave with booty, souvenirs, and prisoners. The difference is that in a campaign they return 6 map turns later with 25% more numbers (125% of the survivors of the battle).
3. Artillery fire is very discouraging to Native Americans. Grape shot fired at natives will cause those receiving fire to shake for morale.

4. Natives caught in the open and fired at by artillery must shake for morale.

### E. Campaign Issues

1. Key fortresses held by one side as opposed to another will influence Native Americans, within the sphere of that fortress, to come and fight for that side. The determination of which fortresses benefit whom is beyond the scope of these rules. In a campaign the umpire will determine which strongholds will have influence.
2. Reinforcements: Native Americans can be reinforced in two ways.
  - (a) Tecumseh can go on a recruiting drive. For every two days (6 moves) he is gone he can return with 10 points.
  - (b) Acquisition of fortresses, briefly mentioned above, which wield influence can increase recruitment. This is scenario specific.
3. Supply
  - (a) Groups of Native Americans of five points or less can live without supply indefinitely. For larger groups the following applies:
 

|              |                                             |
|--------------|---------------------------------------------|
| 6-10 points  | 9 campaign turns without resupply           |
| 11-16 points | 6 campaign turns without resupply           |
| >17 points   | 3 campaign turns (24 hrs.) without resupply |
  - (b) To remain in supply they must keep a supply line open to a native village or military supply depot. If an Indian village is destroyed which was a supply base for a group of Warriors the inhabitants of that village will travel to the Warriors, thereby increasing the supply problems for the Warriors that are now out of supply. The dependents are considered to outnumber the Warriors two to one. This will greatly reduce the amount of time before supplies must be obtained.
  - (c) When out of supply Native Americans will desert at a rate of  $\frac{1}{2}$  of their points per turn. Those deserted forces can only be recovered through recruitment.
4. Prisoners are not a problem for Native Americans, they love them. However, the Christian ethic teaches better treatment of prisoners. Therefore, when prisoners are taken white soldiers must be detailed to protect them from the natives. The player does not have a choice in this. One point of white soldiers must be detailed for each 10 points of prisoners. If Tecumseh is present this rule does not apply.

### Notes - Comments

This image shows a single sheet of white paper with horizontal blue ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.
